Here is what telemetry from the DOVE-1 spacecraft looks like once it's been decoded. Calculations applied to the raw telemetry frame are based on calibration equations labeled "Rev 1":

```

Note that the spacecraft was in eclipse when this telemetry sample was taken (actual location was off the east coast of New Jersey). Also note that the 24-hour UTC clock is one hour slow.

By the way, the software that performed this telemetry analysis was written in 'C' and was compiled and run on a Commodore 64 computer (!!).

Because so much of the chatter on 20 meters sounds like soon-to-be dead men scratching at the covers of their coffins. It's like visiting the last-rites ward in a old folks home.

I haven't been following this line very closely - or mail machine has been sick most of the week - but there seems to be a LOT of confusion being promulgated. I have NEVER earned my living designing natennas, but here goes:-

Probably the basic confusion is caused by whether you are considering the series or parallel equivalent circuit of the anetnna. In either case the thing looks like a capacitor and a resistor (the radiation resistance). There is also the resistor which corresponds to the antenna resistive losses. I think that the performance of short antennas can be understood better using the series equivalent circuit: a series combination of the (resistive) losses in the loading coil, antenna conductor, and ground system; the very small radiation resistance of the antenna; and the capacitance (to everywhere) of the antenna. The series impedance is high, but the useful part, the radiation resistance, is very low.

The radiated POWER is the power "dissipated" in the radiation resistance Pr = Rr * I^2 . Thus you need to get as much current flowing in the antenna as possible. But where can it go? Ah ha, it goes into the capacitance of the antenna, and it's easier to get a lot of current flowing in an electrically large capacitor, thus the large "top-hats" on LF antennas. But this same current also flows in the ground circuit and the loading coil and the actual (not radiation) resistance of the antenna conductor. All the "I^2 * R" loss in these represents wasted power. Thus the need for LARGE conductors so the copper resistance will be as low as possible compared with the radiation resistance - which is very low for electrically short antennas.

I hope this is of some use,   73   Bob   W3OTC

Well - we had quite a turnout on the Un-Net today! I logged:
  N8EMR - gary
  WA7LDV - Jim
  KE9ZM - Gary
  NV3Z - Michael
  WA1RHP - Tom
  W5RRRR/K5ZC - Jay
  N4YRJ - Peter
  N4BYO - Jim
  N5KNX - James

and a couple not affiliated with Internet/Usenet/Bitnet/Fidonet.

We discussed what to do about the endless debates (code-nocode, out of band mods, HT's on airplanes, etc). We found out how Jay got the moniker "The Ignorant Splut." We heard what various folks did for a living and how they connected to the computer side of this network.

In general, a good time was had by all, even though there was a lot of QRM and variable propagation.

As I write this, Jay K5ZC has taken over net control and it is rolling along.

Join us on Saturdays, 1700Z... on 28390-28410 (this time we we at 28390.30)!

The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial BBS, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space. This week's elements are provided below. The Celestial BBS may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial RCP/M, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current elements for the current shuttle mission are provided below. The Celestial RCP/M may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

In article <593@chiton.ucsd.edu>, rec@chiton.ucsd.edu (Richard Currier) writes:
> A good book on the math behind what Brian has described is "Signals and
> Systems", by Oppenheim and Willsky. Prentice Hall. If you really want your
> mind bent "Digital Signal Processing", by Oppenheim and Schafer, Prentice
> Hall, has been the basic text for the past decade.

I recommend Oppenheimer and Schafer's new book, "Discrete-Time Signal
Processing". It's clear enough that you can cookbook stuff out of
it, with some real info (like signal to noise ratios from roundoff)
that I hadn't found in older books.

Subject: FINAL WARNING
To: ALL RADIO AMATEURS
>From: Robert J. Carpenter, W3OTC

On or about Monday, 19 November 1990, I shall begin transmitting on the
50 MHz band from the island of Guadeloupe as FG/W3OTC. I expect to continue to operate in the general vicinity of 50.110 MHz until the evening
of 1 December, 1990, unless the lure of the beach should overcome me.

In article <410007@hpqmole.sqf.hp.com>, dstock@hpqmole.sqf.hp.com (David Stockton) writes:

> I seem to recall a piece in QST, perhaps 1985-1986 about a bloke with an R71 RX. He had dismantled the set ... caused the battery backed RAM to be cleared. I believe he said that reprogramming could not be done in the US - it had to be returned to J-land....

I was the guy who published that note in the 1985 QST, although I posted this on USENET first:

LOSS OF ICOM BACKUP BATTERY FORCES REPROGRAMMING OF RAM

A friend from Wheaton (MD) asked me to post this warning:

If you own an ICOM R71, 751, 271, or 471, don't disconnect the lithium battery on the memory board!

All these models use a common $17 memory plug-in board which contains 2 IC's (one a Japanese 2114 RAM) and a lithium battery.

This fellow wanted to experiment with the memory circuit, so he disconnected the battery in order to install a socket for the RAM.

His radio didn't work when he reconnected everything, and a call to ICOM confirmed that the RAM contains the microcode which gives each model radio its own personality. His board is on its way back to ICOM for reprogramming, which can't be done at the dealer's.

For ICOM owners, this means that when the lithium battery runs down (7 year life), the memory board must be sent in for reprogramming.

....

This fellow is contemplating using his home computer, which uses 2114s to determine the contents of the ICOM RAM, and is looking for other suggestions. It would be useful to modify the contents of the RAM to permit out of band reception.

> No reviews seem to have covered this matter..
> .... The ARRL and RSGB etc presumably will not risk
> their advertising revenue.

Don't sell the ARRL short. It was Gerald Hall, Associate Technical
Editor of QST, who sought my permission to reprint this information
in QST to warn others.

In his March 28, 1985 letter to me, Hall said "We feel an obligation
to make ARRL members aware of this situation, and one of the best
ways would be to publish your bulletin .... [in] QST."

QST DE W1AW
ARRL BULLETIN 46 ARLB046
FROM ARRL HEADQUARTERS NEWINGTON CT
NOVEMBER 17, 1990
RELAYED BY KB8NW/OBS & BARF-80 BBS

TO ALL RADIO AMATEURS

The FCC has released a Notice of Proposed Rulemaking in PR Docket 90-561, proposing minor technical amendments to Part 97 of its Rules that had been requested by ARRL. Other amendments requested by ARRL and three individual petitioners were denied.

ARRL had requested a number of amendments to clean up minor problems arising from the Part 97 rewrite adopted last year. FCC is proposing to adopt new definitions for Bandwidth, Space Telemetry, Telecommand, and Telemetry, minor changes in rules governing telemetry and telecommand, and other clarifications.

The comment deadline is January 31, 1991, with reply comments due March 4, 1991. More information will appear in January QST.

FROM ARRL HEADQUARTERS NEWINGTON CT
NOVEMBER 17, 1990
RELAYED BY KB8NW/OBS & BARF-80 BBS

TO ALL RADIO AMATEURS

On November 16, the US Court of Appeals for the District of Columbia Circuit heard oral argument in ARRL vs FCC, the ARRL petition for judicial review of the FCC decision to reallocate 220 to 222 MHz to the land mobile service. Attorneys for the ARRL and the FCC presented their arguments and were questioned by the panel of three judges that will decide the case. The decision of the Court is expected in a few weeks.

Keyboard stutter, John? :-)

>We discussed what to do about the endless debates (code-nocode,
>out of band mods, HT's on airplanes, etc).

...I'll post a proposal in that regard in a few minutes...

>In general, a good time was had by all, even though there was a lot
>of QRM and variable propagation.

I'll certainly second that sentiment...

>Join us on Saturdays, 1700Z... on 28390-28410 (this time we we at 28390.30)!

Actually, the TS-950 I was using (that Kenwood graciously donated to the
Johnson Space Center ARC [gotta get that plug in!]) claimed we were at
28390.29. Nyah. :-)

I'll see what the IC-781 (that Icom graciously donated :-) says next week...

Originator: jmaynard@

As John Moore, NJ7E, mentioned in his message about the Usenet Un-net today, we discussed possible solutions to the continuing flame wars in this group. I mentioned that I thought that a new group would do it, and nobody thought it was a bad idea, so...

This is a preliminary call for discussion for a new group, to be called rec.ham-radio.legal. The intent is that all discussions about the myriad legalities surrounding ham radio (pizza on the autopatch, out-of-band radio mods, code/no-code, ad nauseam) be moved off there, while rec.ham-radio would continue to carry the more general stuff.

The rationale for .legal is simple: by far and away, the majority of the subjects of flamage in the group are about legal issues and interpretation of the rules and regulations, or proposed changes to the rules and regulations, governing the amateur service. This avoids the narrow focus of the previous call for rec.ham-radio.licensing a year or so ago.

If no serious objections arise in the next week, I intend to start a formal Call for Discussion in news.groups in a week or so. Let's kick it around, and see if we can reach a consensus. I'd like to see a finished proposal ready to go before the news.groupies have a chance to flame it, and hashing out the issues here will improve the group's chance for success.

```

/\

POTENTIAL MAJOR FLARE WARNING

ATTENTION ATTENTION

/\

12:00 UT, November 18

ATTENTION:

A massive sunspot group has developed and is currently located at approximately N19E19 as of 12:00 UT, 18 November. This sunspot group has the potential to produce a major class M or X flare. It consists of 78 spots clustered within a Beta-Gamma-Delta magnetic configuration, covering an area of 9,000 million square kilometers (5,600 million square miles)! This Region (6368) is currently a type FKI optical region and has produced three class M flares over the past 24 hours.

THIS REGION HAS THE POTENTIAL TO PRODUCE MAJOR ACTIVITY.

The Space Environment Services Center estimates a 25% to 35% probability of a major class X flare occurring from this region over the next 72 hours. There is an estimated 80% probability of moderate-level M-class flare activity occurring from this region over the next three days (minimum). There is a 15% to 25% probability of a major proton flare erupting from this region over the next 72 hours. The Space Environment Services Center has issued a condition YELLOW alert status for potential PCA and satellite-level proton events for the next 24 to 72 hours at least. The risk for strong PCA and proton event activity will increase as this region moves towards the western solar hemisphere.

Region 6368 has grown in size and complexity over the past 24 hours. Two delta-configurations have developed in the trailer spot complex of this system over the past 24 hours. This region has the potential to produce some potent activity.

There is a strong potential that a moderate to high intensity SID (Sudden Ionospheric Disturbance) accompanied with a moderate to high intensity SWF (Short Wave Fade) may occur as a result of major flare activity over the next 2 to 5 days on the sunlit hemisphere of the earth. SID and SWF durations could exceed 80 to 120 minutes. Polar regions are at risk for strong PCA activity over the next 2 to 5 days, depending on further developement of Region 6368. Users of polar ionospheric properties (ie. radio operators, researchers, etc.) should be on the alert for potential PCA activity. Satellite users should be on the alert for potential proton events and associated potential satellite disruptions.

Region 6368 might not produce any major flare activity. However, the evidence would seem to indicate otherwise, considering the size, magnetic complexity, and spot density of this major system. Should a major flare occur, a major flare alert will be issued with details concerning the event.

(** Late note - Other people beat me to this un-Net log .. but I did copy QTH and a few other "popin" participants)

Usenet UnNet ....

Pretty successful net this week... but were we plagued by some propagation problems. We had about 12 sign-ins on the 29.390 freq. But, not everyone could hear everyone else. I think John (NJ7E) running power and running a beam was the only one who could hear everyone else and also be heard. So, he became our net control for the first hour. (And, also had the additional burden of "summarizng" things during the rotation so we could all know what was being said.)

Not to waste the beautiful day in Chicago (sunny & 60 deg) - not a common thing these days... I went mobile with my TS-440 & Hustler Vertical. To the best of my driving/writing/talking ability... (and now that I got that disclaimer out of the way) here's what I copied for sign-ins

NV3Z	Mike in Maryland
NJ7E	John ... Arizona
WA7LDV	Jim ... Oregon
K5ZC	Jay ... operating the W5RRR station in Texas (Johnson Space Center - I think ..)
N8EMR	Gary ... ?
KE9ZM	Gary ... me in Chicago, Ill
N4BYO	Jim ... Raleigh, North Carolina
N4YRJ	Peter .. Durham, North Carolina
WA1RHP	Tom ... MIT in Mass. running (if I caught this right.. an all solar-powered station)
N8IXR	???
N7JYC	???
N5KNX	???

I may have gotten this a bit wrong as propagation conditions were not the best. Also, a few non-UseNet people popped in to see what was going on.

Also, thanks to Jay in Texas for taking over as net control after John had to take off. I couldn't stay on for the entire net... but, I think we had a good turnout. Possibly other people signed-in in the second hour after I left.

Jay wrote...
> Actually, the TS-950 I was using (that Kenwood graciously donated to the
> Johnson Space Center ARC [gotta get that plug in!]) claimed we were at
> 28390.29. Nyah. :-)

My TS-440S didn't say 28390.00 either... but, the first call I heard was NV3Z (Mike) and I tuned in on him and then John and the rest came in. So, we were off freq.. a bit.

So much for that...
... Drop in ICOM 24AT price.

Here's some real news.. and some may already know. I have it on excellent authority that the price of the ICOM 24AT will drop by $50. So, if you've been waiting... here's your chance.

But, don't forget that the ICOM 24AT does NOT come with a PL tone unit(UT-51). Thats an optional $50. So, in essence, the price of the ICOM 24AT is now more in line with the other vendor models that include the tone unit as a standard feature.

AES "old" price is $549. (And throw in another $25 for the Larson Rubber Duck)

New Catalog from AES

The new Catalogs from AES will be in the mail this week. The "center-fold" is now new SONY products with Ten-Tec on the cover. Prices in the preliminary copy I saw were not up to date - the final version may have this corrected. For example, the ICOM-24AT did not show the price reduction. (Ham Radio Outlet solves this problem by not giving any prices... which I don't like at all).

Possible ICOM-24AT antenna jack problem...

This happended to me... don't let it happen to you. I do alot of antenna changing... I take my 24AT mobile, so I switch between by Smiley whip and a Coax on a daily basis.

If you find that you antenna jack has become loose in any way... tighten it immediately! The BNC connection is soldered to an "inflexible" tiny component inside the radio. So, continued twisting of the loose jack - even in small amounts.. will break the solder joint and/or the wire component lead. (Maybe mine was poorly soldered in the first place.. ?)

In any case, after I got this fixed, and, after I discovered that I just couldn't get the BNC connector tightened down good enough (What *IS* that thing that holds the BNC to the connection - whew !). I did the following.

Now, I'm sure everyone will cringe at this... but it *did* solve the problem of my loose BNC connector - (possibly forever!). I tightened the "ring" (really, what do you call that ?) and put a drop of Lock-Tight on it. So, if Lock-Tight will hold the various screws and nuts on my motorcycle at 13,000 RPM - I figure it will hold the "ring" on the BNC connector - and, it does.

Well, I remember a QSO I had with a mobile amateur late one night on 75 meters. He was running 550 watts into an endfed quarterwave antenna mounted horizontally one foot above the cargo box of his eighteen wheeler. He said it worked great. He sure had a nice signal. I don't know how effective a shortened antenna would be mounted close above the roof of your bus. I would tend to think that there would be large losses to the top of the vehicle similar to the losses you would experience with a bumper mounted short vertical. I seem to remember some articles in the ham press about an antenna called a Discontinuity Ring Radiator that might be just the ticket. This is basically a broken horizontal loop mounted very closely over a groundplane. As I recall, matching was fairly critical but efficiency was high.

This method has a lot of merit. You can easily visualize where your tones will appear in the band and the math is simple. Hams use the method I described though because it allows them to read the named frequency directly off their tranceiver readout. If they care where their tones actually appear in the band they have to add the offset, but except near the edge of the band most don't really care about this.

Probably because the repeaters are being used for personal communications
between private individuals which was also the original charter of CB.
Of course the FCC screwed that one up by using a band with skip and
saddling the users with amptitude modulation and no repeaters. Add in too
many reruns of the movie "Convoy" and CB turned into a mess. Before
the pseudo-trucker craze, at the sunspot minimum, CB sounded very similar
to many of our VHF/UHF repeaters used by commuters. Except for the
autopatches and talking, beeping, tune playing, repeater controllers. :-(

It's nice to be able to browse the catalog every now and then and think
about what you MIGHT buy if you had the money. Guess which catalog gets
picked up again when there IS some money. Guess where I just ordered an

IC-3220A from.

eyg@hpnjld.HP.COM (Ed Gilbert) writes (re Chalie Thompson's question):

>I think you are both correct. The original question asked about the
>feed point impedance, not the radiation resistance. The feed point
>impedance will be the radiation resistance in series with a very
>large capacitive reactance. Thus the magnitude of the feed point
>impedance will be a high number because of the reactive component,
>even though the real part is small.

Whoops, Charlie, Ed (WA2SRQ) is right, of course. I completely forgot to look at the reactive term. It should have occured to me that the darn thing better start looking like an open circuit as you approach DC. Dumb!

Well, as penance (actually, more of curiosity), I search through some books to see if there are any tables that take you into the 0.001 lambda region. Kraus (2nd ed), for example, has a parametric plot on the R-X plane down to 0.2 lambda (1/2 dipole of 0.1 lambda). Wolff has precisely the same plot, but on Smith chart instead of cartesian (hmmm...). But I couldn't find anything else that would take me lower.

Well, I don't have NEC (nor miniNEC), so I decided to start at the 1st-order Hallen equations and did some numerical integration. I found a large variation on the diameter of the wire you use -- so, here is a list that may be useful (again, values are for a 6m dipole; half the reactance for a 3m monopole):

        6m dipole at 100 kHz

Element radius (cm)	Reactance(kOhms)
0.1	-110
0.3	-89
0.5	-80
0.7	-73
0.9	-69

(Eeek, -100 kOhms at 100 kHz is about 15 pF - bletch! you won't believe the size of the inductance you will need to tune this sucker out - start looking for a couple of surplus "88 mH toroids" :-) Two of them might just do it :-) :-).

I don't really know how good these numbers are, since it was a quick C hack that I did in the middle of the night. It wasn't a complete waste of time; 20m was pretty dead by then anyway, except for W6YX blasting my speaker with "CQ SS" and having to repeat "28 Santa Clara" because no one believed 'YX has been around for that long. :-)

The increase in the magnitude of the reactance as you make the elements thinner seems to make sense. I.e., capaciatance increases as you make the elements fatter.

Anyway, the numbers I get for the region from 0.2 lambda to 1 lambda agree well with the figure in Kraus, so maybe they are OK. For the integration, I chopped the dipole into about 80 pieces (not so bad on a MacCX; and only took a few seconds on the MacCI when I ran it here at work).

Another thing that I discovered while playing with the integrals: making the assumption that an elemental dipole models a small dipole is *not* that good. You can be off by up to a factor of 4. The reason for that is because elemental dipoles assume a constant current through the entire element, whereas even a small dipole will necessarily have the current at the tips of the dipole be at zero. Good ole' boundary conditions :-)

Now, QSY back to pizza wars.

I would like to see some specific reasons for the establishment of yet another ham group. Proponents should take advantage of the opportunity to lay out all their reasons for such. I get the feeling that some folks are outraged by any sort of controversy - they call it "flaming". Everything that is not milky bland or highly technical or supportive of the (genuflect) ARRL is to be shunned by the enlightened - right?
Come on folks, let's not become too stultified. Sure, the code-no code discussion seems unending. So what? I would really prefer to exclude all the mentalities that are horrified ("bored") by controversy. Reasoned arguments are the spice of life. Even the Russians are able to disagree now without being sent to Siberia!

I'm looking for information on Yaesu's miniCAT (Computer-Assisted Tuning) connector on my 727R HT. In the past I've heard that this info is difficult to come by... I've heard it's a 4800 baud serial port.

I picked up an interface to it for the Commodore 64. (It turns out the guy who sold it to me had put it together wrong. It was easily fixed by following the intstructions.) Now it works, but I want to build one for RS232 to use on my Amiga.

What I really need is a list of instructions and format that I can send to the radio to perform the front panel operations. (I'd rather not "reverse-engineer" it.)

Forgive me if this topic has been covered, I've been away from this group for a while.

Please email responses. Thanks.

Dave

--- SOLAR TERRESTRIAL FORECAST AND REVIEW ---

November 17 to November 27, 1990

Report Based In-Part from Data Obtained from the
Space Environment Services Center
Boulder Colorado

SOLAR TERRESTRIAL REVIEW FOR 11 NOVEMBER TO 17 NOVEMBER.

Solar activity has been low to moderate over the past week. Several M-class flares were produced this week. Region 6361 produced produced two class M flares early this week. The first, rated an M2.1/SF, occurred at 04:36 UT on 11 November (location N10E18). The second, an impulsive class M1.6/SN flare, occurred at 04:45 UT on 13 November and lasted only a mere 7 minutes. Region 6361, which has now stabilized to a beta configuration, rotated beyond the western limb on 18 November.

A very potent and massive sunspot system has developed and is currently located (as of 18:00 UT on 18 November) at N19E15. This spot group is a huge 9,000 million square kilometers (5,625 million square miles) in size and encompasses a total of 78 sunspots. It's angular extent is 21 degree's. This potentially powerful sunspot group has a Beta-Gamma-Delta configuration (a magnetic configuration capable of spawning very powerful class X flares). This sunspot region is being monitored closely for signs of potential major flare developement. This region is capable of spawning a major class-X / 2B to 3B proton flare.

This region has spawned three class M flares over the past 24 hours, all three of which are suspected of producing SWF's (Short Wave Fades). The first, an M1.1/SN flare occurred at 18:48 UT on 17 November (location: N18E26). The second, an M2.4/SF occurred at 19:46 UT (location N21E18) and lasted for 54 minutes. The M-class flare was rated a class M1.1/1N, occurring at 22:45 UT (location: N15E28). In addition, Region 6368 also produced a class C8.8/2N flare at 17:45 UT. This flare began at 17:00 UT, and ended at 18:07 UT, lasting a total of 67 minutes.

Geomagnetic activity was mostly quiet through the early part of the week. Activity reached it's lowest level on 14/15 November. On 16 November, activity increased to active levels (with minor storming at high latitudes). A magnetic perturbation of 565 nanoteslas was observed at several high latitude observatories between 11 and 12 UT on 16 November. Most middle and low latitudes experienced only unsettled to active conditions. No significant storming occurred this week.

Auroral activity was not visible through the early part of the week, but increased rapidly to moderate levels over middle latitudes (and sporatic bursts of high levels over a few high-latitude stations) on 16 November. Activity decreased to low levels over middle latitudes on 17 November.

Radio propagation conditions were very good early in the week. However, conditions rapidly worsened on the evening of 16 November due to the increased auroral activity. Rapid signal flutter and fading was prevalent over most middle and high latitudes on 16 November. Conditions improved to near normal or slightly below normal on 17 November. Three noteworthy SWF's interfered with some daytime communications on 17 November, associated with the three M-class flares which occurred on that day from Region 6368.

SHORT TERM SOLAR TERRESTRIAL FORECAST

There is a risk for some major flaring to occur over the next 3 to 5 days (minimum) from Region 6368. The penumbral extent of this region is enormous. The magnetic complexity is clearly apparent, particularly in the trailer spot complex. This region will continue to spawn minor M-class flares over the next 3 to 5 days at least. The Space Environment Services Center estimates a 25% to 35% probability for a major class X flare occurring from this region over the next 3 days (day 3 = 20 November). In addition, estimated probabilities for major proton flaring is held at 15% to 25% over the next 3 days. The Space Environment Services Center has also issued a condition YELLOW alert status for potential PCA and proton event activity over the next 72 hours. This region is capable of producing some major activity. For more information, see the Potential Major Flare Warning which has been posted separately.

Geomagnetic activity is expected to rise to active levels again over the next 72 hours due to a fairly well positioned coronal hole. Minor storming may be possible at higher latitudes with the onset of this activity. Middle and low latitudes are expected to remain mostly unsettled with periods of active conditions. These forecasts exclude the potential for major flare-induced activity. Should a major flare occur, a potential impact analysis with revised forecast charts will be posted with the flare alert. Geomagnetic activity may also increase on 22/23 November when residual emissions from Region 6368 are expected to reach the earth.

Auroral activity is also expected to become more apparent over middle and high latitudes, particularly on 19/20 November when coronal hole induced conditions are expected to be most active on these dates at all latitudes. Activity should reach moderate levels at high latitudes with potential sporatic bursts of high activity becoming visible at several high-latitude locations. Middle latitudes will experience mostly low to moderate auroral activity. Low latitudes will not likely be able to witness any auroral activity this week, unless a major flare has a strong impact with the earth. Excluding potential major flare effects, the auroral zone will likely experience a slight southward shift, particularly on 19/20 November.

Radio signal propagation conditions are expected to be mostly normal over middle and low latitudes for the coming week. Degraded conditions may occur on 19-20 November due to coronal hole effects, although the worst conditions will likely remain confined to the high latitudes and northerly middle latitude regions. Central and southern middle latitude regions may experience periods of strong auroral-induced signal flutter and fading on the evenings of 19/20 November due to increased auroral activity. However, propagation during the daylight hours should be mostly normal over most middle and low latitudes, excluding periods of SWF (discussed below).

There is a strong risk (60% to 80%) of SWF and SID occurrences on the sunlit hemisphere of the earth over the next 4 to 7 days due to minor and possibly major flare activity. SWF and SID durations could exceed 80 to 120 minutes. The risk for strong PCA activity is also evident due to Region 6368's threatening configuration. Users of polar and high latitude signal paths should be aware of the potential for possible radio blackout conditions over polar and high latitude regions, should a major flare occur. Likewise, users of satellites and satellite-propagation should be aware of the increased risk for satellite-level proton events and potentially strong major-flare induced ionospheric impacts.

SUMMARY OF ALL ACTIVE REGIONS VISIBLE ON THE SOLAR DISK AS OF 18 NOVEMBER

Region #	Location	LO	Area	Class	LL	Spots	Magnetic Type
6358	N14W93	145	0900	HAX	05	001	ALPHA
6361	N06W81	133	0360	DAO	07	005	BETA
6364	S30W77	129	0450	CAO	04	004	BETA
6366	S21W48	100	0420	CAO	07	011	BETA
6368	N19E25	027	9000	FKI	21	078	BETA-GAMMA-DELTA
6371	N18W17	069	0030	BXO	04	008	BETA
6372	S17E66	346	0330	HAX	02	002	ALPHA

NOTES: Area is in million square kilometers. Angular extent (LL) and solar longitude (LO) are in degree's. For more information regarding the terminology used above, request the Glossary of Solar Terrestrial Terms from: "std_oler@hg.uleth.ca".

H-ALPHA PLAGES WITHOUT SPOTS. LOCATIONS VALID AS OF 24:00 UT ON 17 NOVEMBER.

REGION	LOCATION	LO	COMMENTS (IF ANY)
6360	S18W85	137	
6367	N41W25	077	

ACTIVE REGIONS DUE TO RETURN BETWEEN 18 AND 20 NOVEMBER

Region	Latitude	Longitude (Helio.)
NONE		

NOTES:

    |_________________________________________________________________|
```

NOTES:

This graph ONLY depicts geomagnetic conditions observed at Boulder, Colorado for the past 87 hours. Conditions to the north of Boulder will generally have slightly higher activity than Boulder, while conditions to the south of Boulder will likely have lower activity than those depicted here. However, the plots should present a good approximate average of planetary geomagnetic conditions.

"Anomaly Intensity" is meant to represent nothing more than a very rough guide to the --potential-- interaction geomagnetic fluctuations --might-- have on earth-based systems sensitive to magnetic fluctuations (ie. electrical power distribution networks, telecommunications networks, etc.).

For radio signal propagation purposes, plot lines are approximately proportional to propagation quality when plot lines are below Minor Storm conditions. Propagation quality may deteriorate rapidly (ie. non-proportionally) when plot lines reach or exceed Minor Storm levels. Complete radio blackout conditions on all short-wave frequencies may occur if plot lines reach or exceed Severe Storm levels.

```

NOTES:

Predicted geomagnetic activity is based heavily on recurrent phenomena. Transient energetic solar events cannot be predicted reliably over periods in excess of several days. Hence, there may be some deviations from the predictions due to the unpredictable transient solar component.

```

NOTES:

Latitudinal boundaries are the same as those given above for radio propagation quality. Periods of high auroral activity may be suitable for auroral-propagation. Locally visible moderate auroral activity will almost always cause moderate to strong deterioration in HF signals, while locally visible high auroral activity will render most HF bands useless.

Auroral activity is defined as follows:

NOT VISIBLE: Not visible

LOW: Diffuse, inactive auroral activity visible very near the northern horizon for mid and low latitudes.

MODERATE: Visibly active, but not exceptionally bright auroral activity most visible above the northern horizon for mid to high latitudes. This type of activity usually encompasses torch-like (or beam-like) aurorae mixed with low-intensity curtain aurorae.

HIGH: Visibly very active, with periods of bright, pulsating curtain aurorae possibly mixed with moderate intensity zenith aurorae. Can occur to the north as well as stretching up near the zenith, particularly at middle latitudes. There may be some color fluctuations discernable.

VERY HIGH: Very active, very bright and very colorful auroral activity possibly mixed with intense zenith and curtain aurorae. Visibly strong pulsations with auroral boundaries to the zenith, stretching even partway to the southern hemisphere of the sky.

EXTREMELY HIGH: Rare, incredibly bright auroral activity with rapid color and brightness fluctuations mixed with very strong rapid auroral pulsations visible throughout the entire sky.

There are three plotted lines per day in the auroral activity prediction charts. Each of these three plotted lines represent three periods during the evening/morning when auroral activity can be seen. The first line represents the evening twilight period. The middle line represents the --local-- midnight sector, while the last line of each day represents the morning twilight period.

The auroral activity predictions charts are heavily based on recurrent phenomena and may not be accurate in the longer-term due to unforseen and unpredictable transient events (ie. such as solar flares).

The visibility of auroral activity depends on your location and the brightness of the sky (which is dependent upon both city lights and lunar phase). These charts do not account for these variations. The charts are based on dark-sky conditions (lunar phase excluded). Aurorae occur independent of sky brightness, so just because auroral activity may not be directly visible (due to lunar phase, for example) does not mean auroral activity isn't in progress.

=========
SpaceNews
=========

MONDAY NOVEMBER 19, 1990

SpaceNews originates at KD2BD in Wall Township, New Jersey, United States. It is published every week and is made available for unlimited distribution.

* MARS VISIBILITY *
===================

The planet Mars will be visible to those living on the east coast of the United States. The planet will appear as a reddish "star" in the eastern sky. Best viewing will begin around 8:00PM local time. Mars will be closest to Earth on Tuesday, when it will be about 48 million miles from Earth. Viewing should be equally good through early December.

* SALYUT-7 NEWS *

The presently unused and long abandoned Soviet space station 'Salyut-7' is tumbling uncontrollably and is predicted to re-enter the Earth's atmosphere in mid-January. Attempts to boost the 60 metric ton structure to a higher orbit have failed. Salyut-7 should produce quite a spectacular light show if it re-enters the atmosphere away from sunlight.

Here is element set 633 for Salyut-7 as released by NASA on 14-Nov-90:

```
Epoch    : 90 318.01787657

* PACSAT NEWS *

Work continues on UO-14 and AO-16. DOVE-1 will be reset shortly after software testing on the other Microsats is complete.

* RS-14/RUDAK-2 NEWS *

Reliable sources within the Soviet Union indicate that the launch of RS-14/RUDAK-2 is now expected to happen on or about November 24, 1990. UA3CR requests the help of radio amateurs all over the world to collect telemetry and send it via packet radio or via a SSB net to him. The first day's worth of telemetry will transmitted via a CW beacon at 20 WPM on 145.822 or on 145.948 MHz SSB and will be vitally important to ground controllers. Later, after ALL systems are working properly on the RUDAK-2 transponder, PSK/BBS/MODE B operations will begin.

After six months of "read-only" privleges for this newsgroup I've finally been granted post priveleges. The following is six months of bottled up questions for the ham-radio gods out there.

1) about Yeasu FT-736R's: is there a modification that will allow this radio to receive weather-satellite downlinks on 137.xxx mHz? The specs say that it has a 50kHz IF bandwidth, so I should be able to copy the signals without too many problems if I could only get it to rx that low.
2) about az-el rotors: we have the Yeasu GB-5400 az-el rotors swinging 3 KLM beams (2meter, 70cm, and 24cm). We also have a 386 machine. The logical question for a EE major is: How can I control the rotors using the computer? I have some ideas that would involve a game card and a parallel printer interface, but I'd like to tap the net's collective intelligence on this.
3) about IC-781's and IC-4KL's:
    a) has anyone had any success using the built in data display for rtty work? Can I use a TNC (esp. an MFJ-1278) or can I build a dedicated-RTTY device that takes that output from the data jack, decodes it, and feeds it strait back in. Anyone have any experience with this?
    b) I've made the 10m conversion to the IC-4KL, but it doesn't have "28" light on the remote controller so the average idiot in the station can't tell that the linear is ready for 10 meters. Does Icom sell an upgrade that allows for this?

Item of Note: After playing with the '781 for about a month, I'll concede that it's a hell of a radio, but it's not much better than a TS-440 with the external station monitor and a palomar pre-amp...

4) about TNCs: Is the MFJ-1278 suitable for receiving APT format weather satellite downlinks (re: question #1)? What software/

additional hardware do I need to get weather pics?

I have a Kantronics TNC-2 with rom update 2.83 (dated 1988). Is there a new version of the ROM, and is it worth the update? BTW, I tried running packet on my FT-470 but the TNC throws off so much RF that it desenses the radio to the point that it's worthless. My ancient (!) IC-2AT does a great job of it though. I still think the 470 is the neatest handheld on the market.

Since we have satellite capability in the station, what PSK modem is the best? Is there one that we can piggy-back on an existing TNC, esp MFJ 1278 or TNC-2?

I guess that about covers it. We are trying to automate as much of the station as possible, so any tips or hints concerning computerized control of radios, antennas, TNCs, etc. is greatly appreciated.

You are correct about the bumper mount being useless.

The solution I used on a landcruiser wagon, was to put a marine rachet mount on the roof. On the interstate, I ran with the antenna straight up. In town I ran at 45 deg, and I could lay it flat when I was not using it.

It out preformed the same antenna mounted on a fender, and the bumper mount was useless, even when on the front.

An interesting side effect was that with the antenna at 45 deg, it still worked ok. I think most hf whips will "lay down" quit a bit, unless you guy them. By running at 45 deg, it tended to sway less.

I saw a neat design on a full sized van at Dayton. The
owner claimed it worked as well as anything else he had
tried.

I will try to dupe:

```
                                                   |
                                     |      |      |
                              |      |      |      |
                              |      |      I      I
                              I      I      I      I
   Alum. Angle                I      I      I      I  <- hustler
      ->   _________________________________________     resonators
feed pt->  |                  i                    i  <- insulators
-------------------------------------------------------------
   ^ Van roof
```

I can see how this would not be to different from a
laid over hustler with a "spyder"

I have switched from hustler to monoband 8' fiberglass
whips. The ones I use are one piece, and work ok. (I think
the hustler may radiate better.) The reason I switched is
I can use the fiberglass ones without a spring, and still
drive in the woods. I have bayonet mounts, and can change
whips quickly. I still wonder if a stainless whip, with a
base mounted auto antenna matcher is not the best way.

Not using a spring allows the antenna to stay erect at speed,
and keeps the swr from varying. This offsets the slight
advantage the hustler has. The hustlers do seem to have
slightly higher bandwidth.

If you drive around much with hustlers on, you will break some
resonators. Springs help some, but you will still hit things, and
at speed, the springs do little. The fiberglass helicals are
pretty rugged.

There is a green book out called "35 yrs of HF mobile", or something
like that, which has lots of good info.

I have quit playing very much mobile, except on trips, but still
keep the radio in the 4wd. I carry a dipole, and coax. You will
find that same conditions, it can make a 20db difference vs your
mobile antenna, even cross polarized.

Oh well... just my experiences...

At the moment, I'm contemplating purchasing one of these two radios,
but I'd like to know what modifications are available for them.
I suppose I'm really interested in knowing what mods are available, how
extensive the mods are, and how well the mods work.

What kinds of extended receive ranges are there?

Are there any after-market accessories like a DTMF pager?

Thanks for any comments,

Terry Domae

Nntp-Posting-Host: thesis1.hsch.utexas.edu
Originator: jmaynard@thesis1.hsch.utexas.edu

I'm going to slow down the schedule for the rec.ham-radio proposal slightly,
due to the realities of the moderation process for news.announce.newgroups,

which is the official place for the formalities of the newsgroup creation process, and the fact that this is Thanksgiving week in the US. Since the moderator only posts messages weekly on Sunday night, and will only guarantee to post things he gets by Friday evening, I'll post the formal Call for Discussion at 5 pm Friday, 30 November if there's support for the idea. This will make the discussion run from Monday, 3 December through Monday, 31 December, and a 21-day voting period run from 31 December until 20 January. I agree this isn't the best schedule, but the Guidelines for Newsgroup Creation (available at a news.announce.newusers near you) specify these as the minimum lengths of time for each phase of the process. (Fun, fun!)

If you missed the original posting, rec.ham-radio.legal is intended to be the place for the interminable discussions that crop up here about rules and regulations, both existing and proposed. Recent topics that generated lots of flamage, such as out-of-band mods for radios, pizza on the autopatch, and HTs on airliners, as well as the ever-[un]popular code/nocode war, are the kinds of things that rec.ham-radio.legal will contain. It's apparent to anyone who's been reading this group for any length of time that those kinds of topics aren't going away, so this is an attempt to make it easier for those who have grown sick of the whole business to ignore it, without having to ignore everything posted by given authors (as the kill file posted here recently does).

Nick Sayer suggested a Frequently Asked Questions/Arguments posting for the group. I think this is a good idea, and would like to see it; unless someone else has a burning desire to generate one, I'll probably tackle it myself, but it'll have to wait until after Thanksgiving. I'll gladly accept help on this one, too.

Popular Monitoring Times Columnist and host of WORLD OF RADIO, Glen Hauser will be heard on WWCR, The powerhouse international broadcaster, beginning Sunday 25 November 1990. His broadcasts will then be aired regularly thereafter. Convieniently scheduled for 8:30pm Eastern Standard Time (0130UTC while the USA is on Standard Time), and blasted out with a few MILLION watts of ERP on 7520 KHZ, Glen will be heard for the first time reliably in Europe.

You might be aware that Glen's WORLD OF RADIO has aired for many years over WRNO, the one time powerhouse gone flea power. With the WRNO signal now more of a JOKE than a broadcast service, Hauser has made the right move.

Interestingly, the program will air RIGHT BEFORE the four hour weekly broadcasts of RADIO NEW YORK INTERNATIONAL, making sunday a true night for good listening for the shortwave buff.

If you are a regular listener of Hauser's program, you are no doubt aware that it is a mixture of Good DX and station news, tips, tidbits, and a smattering of left wing political commentary. Hauser is an athiest, and in the past has featured "TIPS FOR RATIONAL LIVING" as part of his program. This feature ridicules religious practice, and promotes humanism. I will be very interested to see if Hauser continues this feature now that his program will be heard over WWCR, which is a Christian Station.

Most of the programs aired during the week on WWCR are a mix of Religious programs, most of them in the old time religion vein during the day. In the evening, the station switches to talk shows from the SUN RADIO NETWORK, with Chuck Harder (Consumer help and weird science) and Tom Valentine (Right Wing Politics and WEIRDER science).

Last week Harder talked about the N-MACHINE, which is a device that is supposed to produce more electric power than it takes in, making it in effect a perpetual motion machine. Valentine, not to be outdone, had on a man who claims that his invention has lowered SMOG in Los Angeles, through manipulation of the "ether". The anti-smog machine has no moving parts, but relies on its geometric shape to dispell the noxious fumes. He wants the Los Angeles City Government to pay him a million dollars a month to continue his services. He cites the figures that prove his device works, and even uses newspaper headlines about lower smog levels. Since Los Angeles is ignoring him, he is packing up his technology and going to Japan with it. He says "Just you watch. NEXT YEAR the smog levels will increase". Of course if they do, he will have all the impirical evidence he needs. And if they don't... Well we won't hear from HIM any more.

In any case, HAUSER has also ridiculed these programs, and encouraged people who have any scientific knowledge to call and try and debunk these guys. When someone DOES call though, Valentine refuses to let them speak if they disagree, or he chides them. After being so critical of the station and its programming, Hauser now finds himself on the same station.

It is probably NO ACCIDENT though that WORLD OF RADIO will be airing immediately before RNI's weekly shows.

RNI and its rotating schedule

7520 KHZ 0200 - 0600 Z Via WWCR Sunday (USA) Monday (UTC)

Radio NewYork International, meanwhile has settled down to a very regular schedule. Unfortunately, the best program host (Johnny Lightning) is heard only once a week. My own personal LEAST-favorite (Pirate Joe) is heard twice a month (or more depending on the month) Now if you are a lefty liberal 1960's anti war-save the wales-peacenick who gets into those old vietnam era protest songs and mindset, YOUR mileage might vary. I prefer irreverance and biting satire, ala Johnny Lightning to the predictable Pirate Joe. Other shows include "A different kind of oldies show" which is not all that different a kind of oldies show, really... AND the Steele Ship (host Randi Steele), who is in a similar mold to pirate joe, but not quite as bad. So far, the WORST RNI program was Pirate Joe broadcasting a distorted recording of the ANTI WAR rally which took place in NYC in protest of the Desert Shield Situation. Joe must be in his glory with another war to protest. EVERYONE I know who listens to RNI flipped the station off after the program got interminable. I bet even the most loyal RNI listeners just could not take this program. HOW ABOUT IT, ANYONE ELSE LISTEN THAT NIGHT?

That's all of my time.

Thank you for Yours.

SB ALL @ AMSAT $ANS-321.01
DX-PEDITIONS A PLENTY (Pt 1)

HR AMSAT NEWS SERVICE BULLETIN 321.01 FROM AMSAT HQ
SILVER SPRING, MD NOVEMBER 17, 1990
TO ALL RADIO AMATEURS BT

Island DX-peditions should keep Satellite DXers busy

With some indispensable help from Gary Garriott, WA9FMQ, Eric Rosenberg WD3Q has been granted a reciprocal license in the Dominican Republic and will be operating as WD3Q/HI3 from Saturday, 24 November to Thursday 30 November from Puerto Plata on the north coast of the country. He expects to be on AO-13 mode J and B every day, but as this is a family holiday, one never knows whether this will actually be the case!! He is planning to be active on Thanksgiving weekend, and hopes to check into the Operations Net (145.950 MHz) on Saturday morning.

The equipment comes from Mike Crisler, N4IFD (antennas, amplifiers, preamps, feedlines, et al), and Art Feller, KB4ZJ (FT-726R radio). Mike has designed a portable mast, tripod and antenna mounting system for the small KLM twin antennas that fits in a 7 foot x 6 inch PVC pipe. Eric plans to take as many pictures as possible and will publish an article for a future issue of AMSAT Satellite Journal.

The windows for this operation are tentatively scheduled as follows:

```
SAT 24-NOV-1990  1400     to 1900
SUN 25-NOV-1990  1300        1800
MON 26-NOV-1990  1100        1630
TUE 27-NOV-1990  1000        1500    <--
```

```
WED 28-NOV-1990  0900        1330     | He may not start until 1100 UTC or so
THU 29-NOV-1990  0730        1230    <--
```

All dates and time are in UTC.

Those fortunate enough to work Eric can QSL to his home address of:
338 14th Street NE, Washington, DC 20002

Revised RS-14/RUDKAK-2 Launch Set For November 29, 1990 +- 1 Day

AMSAT-DL officials have been informed that the launch of RS-14/RUDAK-2 will occur on or about November 29, 1990, plus or minus one day. Also, it is not expected that the RUDAK-2 transponder will be turned on until three days after launch. Radio amateurs should not expect to hear the CW beacon from RUDAK-2 until December 1, 1990. Efforts are still under way to provide a launch net on 20M starting about an hour before launch. UA3CR requests the help of radio amateurs worldwide to help collect telemetry and send it to him via packet radio to him once the CW beacon is turned on. The CW telemetry beacon can be heard on a downlink frequency of 145.822 or 145.948 MHz SSB. At this time the exact launch window has not been announced, nor have the preliminary Keplerian elements published. Please stay tuned to AMSAT Nets and AMSAT News Service (ANS) bulletins for late breaking news concerning the launch of this exciting new OSCAR.

[ANS would like to thank DB2OS for providing the information in this bulletin.]

WO-18 STATUS

HR AMSAT NEWS SERVICE BULLETIN 321.04 FROM AMSAT HQ
SILVER SPRING, MD NOVEMBER 17, 1990
TO ALL RADIO AMATEURS BT

Efforts To Understand WO-18 Attitude Continue; New Picture Software Uploaded

Ground controllers at Weber State University (WSU) are continuing their efforts to analyze the attitude behavior of WEBERSAT-OSCAR-18 (WO-18). They have observed over the past several months that WO-18's Z-axis spin rate has been slowly decreasing. In an effort to understand this phenomenon, the students in the Computer Science Department are building a database to store the past ten months of real-time telemetry and Whole Orbit Data (WOD) collection. This will allow engineers to retrieve data and plot telemetry parameters quickly for analysis. Storing this much data immediately presents a significant challenge in view of the enormous volumes of data involved, however, ground controllers will have valuable tool in order to characterize spacecraft motion and health.

To cope with the slowing of the spin rate of WO-18 and to enhance picture taking, new on-board software has been uploaded to WO-18. This imaging software has the added "smarts" to look at the solar array (S/A) currents, wait for a specified S/A current, and then snap a picture. By using solar array currents, WSU engineers will use this information to predict when the CCD camera is earth pointing and thus produce better pictures.

In the upcoming weeks, new software will also be loaded to include the CCD Light Spectrometer data in the telemetry. The spectrometer is designed to measure the spectrum of sunlight reflected from the earth's atmosphere. This will provide scientist with the composition of the atmosphere at specific places and times.

Radio amateurs who wish to process WO-18 images can obtain more information about WEBERWARE 1.0 from the AMSAT Software Exchange at AMSAT-NA HQ's.

MICROSAT UPDATE

HR AMSAT NEWS SERVICE BULLETIN 321.05 FROM AMSAT HQ
SILVER SPRING, MD NOVEMBER 17, 1990
TO ALL RADIO AMATEURS BT

Engineering Team reports on current status of Microsats

Beta testing of the new PACSAT BBS software uncovered a minor bug which could only be discovered while the bird was being used by multiple stations. After analysis of a memory dump from AO-16, the failure mode was discovered and was reproduced on a ground-based Microsat simulator. The problem was fixed and AO-16 was scheduled to be reloaded with the new code during the weekend of 17 November 90.

The AMSAT Microsat Engineering team has generated the following update on all the Microsats dated 16 November 90:

AO-16

AO-16 is currently running the basic command and telemetry system, without the Whole Orbit Data (WOD) routines. This is in preparation for a full reload this weekend with an updated operating system. Fixes include various improvements in memory utilization, making more memory available to application programs.

This operating system will support the first production version of the file server software, loading will start this weekend. The new version will support the full 8 megabyte file system.

DO-17

No Changes. Uploading of new software is planned for December.

WO-18

The version 3.0 imaging software was unloaded 11/13/90. The 3.5 version was loaded 11/14/90. This version uses the arrays currents as well as the horizon sensors in the attitude determination algorithm. A variable timer has been added in order to allow a longer time for constraints to be met before an image capture is triggered.

LO-19

No Changes. Uploading of the pacsat file server is planned for late November.

AMSAT Argentina Satellite Symposium Proceedings Published
During the weekend of 22 September 90, AMSAT-Argentina held a Satellite Symposium in Buenos Aires, Argentina. ANS has be informed that the Proceedings of that meeting have been published and are now available.

The Proceedings total approximately 90 pages and based on the index of papers included (13 in all) and because the Symposium was held in Argentina, one can assume that the Proceedings are published in Spanish. For more information on these papers, contact:

Carlos Calvo   1424, 1er Piso, Capital Fed.

TE: 32 0555, 26 0505.

ZRO TEST SCHEDULE

HR AMSAT NEWS SERVICE BULLETIN 321.07 FROM AMSAT HQ
SILVER SPRING, MD NOVEMBER 17, 1990
TO ALL RADIO AMATEURS BT

Fall Edition of ZRO Test Announced

The ZRO Memorial Technical Achievement Award Program, or just "ZRO Test" has a new schedule through the end of 1990 via AMSAT-OSCAR-13. This activity is a test of operating skill and equipment performance tested by copying signals decreasing in strength in predefined steps. At the beginning of the run, uplink power from the control station is set to match the general beacon downlink strength. This is level "zero". The control operator will send and repeat a random five-digit number, then lower uplink power by 3 dB (half power) and repeat the procedure with a new random number. This will continue to a level 27 dB below the beacon (level "nine"). A participating listener monitors the downlink signals till they can no longer copy the numbers. Those who can hear the beacon will qualify for the basic award by copying the code group heard at level "zero". The challenge is to improve station performance to a point where the lower-level downlink signals can be copied (levels 6 through 9). This then results in the need for less uplink power for routine communications operation.

The following schedule of Mode "B" and "JL" ZRO tests were chosen for convenient operating times and favorable squint angles. The "B" tests can be heard on 145.840 MHz and the "JL" test on 435.945 MHz.:

Saturday November 24, 1990 at 1700 UTC "B"

Saturday December 1, 1990 at 2030 UTC "B"
Saturday December 15, 1990 at 1630 UTC "B"
Saturday December 22, 1990 at 0530 UTC "B"
Saturday December 22, 1990 at 0645 UTC "JL"

Note that the dates and times are noted in "UTC." The tests on December 22nd occur late Friday night for those in North America. Any changes will be announced as soon as possible via the AMSAT HF and AO-13 Operations Nets as well as ANS. Recently updated ZRO brochures are available from WA5ZIB, Andy MacAllister, AMSAT V.P. User Operations, 14714 Knightsway Drive, Houston, TX 77083 for an S.A.S.E. with two units of postage. The brochure describes test procedures and means for obtaining certificates and gives some historical background about the program.

All listener reports with date of test and numbers copied should be sent to WA5ZIB at the address above. A report will be returned verifying the level of accurate reception. Good luck!

OPERATIONS NET SCHEDULE
HR AMSAT NEWS SERVICE BULLETIN 321.08 FROM AMSAT HQ
SILVER SPRING, MD NOVEMBER 17, 1990
TO ALL RADIO AMATEURS BT

AMSAT-NA Operations Net Schedule Announced

AMSAT Operations Nets are planned for the following times.
Mode B nets are conducted on an AO-13 downlink frequency of 145.950.
Mode J/L nets are conducted on an AO-13 downlink frequency of 435.970.

Date	Phs	mode	UTC	NCS	Alt.	U.S. day
24 Nov 90	97	J/L	1430	WD0E	N5BF	Saturday
02 Dec 90	63	B	1530	WB6LLO	WA5ZIB	Sunday
08 Dec 90	156	B	1300	WB9ANQ	KA5SMA	Saturday
15 Dec 90	97	J/L	1400	N5BF	WD0E	Saturday

STS-37 astronaut Jay Apt (N5QWL) will be the featured guest on the 24 November 90 net. Jay will be discussing late plans for his own flight, which is to be flown next spring, and STS-35, which is scheduled for early December. This round table-interview session with N5QWL promises to be very interesting.

Nets are scheduled for North American geographic coverage and time zones although other parts of the world are often within the footprint and check-ins from everywhere are welcome. Those who don't have adequate and convenient coverage from this net are encouraged to schedule their own nets via AO-13. Write to AMSAT Headquarters or send a note to N5BF @ WB6YMH with your schedule to have it included in ANS.

For information on the amateur satellite program and how you can participate, contact AMSAT-NA Headquarters at P.O. Box 27, Washington, DC 20044, phone (301) 589-6062, or contact your local AMSAT Area Coordinator.

SB ALL @ AMSAT $ANS-321.09
FALL AO-13 TRANSPONDER SCHED

HR AMSAT NEWS SERVICE BULLETIN 321.09 FROM AMSAT HQ
SILVER SPRING, MD NOVEMBER 17, 1990
TO ALL RADIO AMATEURS BT

The transponder schedule for AO-13 is as follows:

Mode-B : MA 000 to MA 095
Mode-JL: MA 095 to MA 125
Mode-LS: MA 125 to MA 130
Mode-S : MA 130 to MA 135
Mode-BS: MA 135 to MA 140 <--- QRP on Mode B Please
Mode-B : MA 140 to MA 256
Omnis : MA 220 to MA 040

This schedule is expected to continue through 26 Dec 90.

The command team requests that you make a specific effort to use QRP on Mode B between MA 135 to 140. This is specifically to help those people experimenting with Mode S. (Although you really should always keep checking that your peak signal is never stronger than the beacon (145.813/435.651 MHz)

The spacecraft attitude of AO-13 is calculated to be:
BLON = 179.1 and BLAT = -1.5 for 19 November 90

AMSAT-OSCAR-10 has come out of hibernation and appears to be receiving sufficient solar panel illumination to support Mode-B transponder operations. The transponder may be used, carefully, at all points of the orbit except MA 254 - 006 when eclipses occur. If beacon or transponder signals show signs of FMing, users should cease all transponder use immediately.

Caught this item in 73 mag. thought people would be interested...

Kenwood now has a new warranty program...

Effective Oct 1,1990 all new Kenwood transceiversm recievers, accessories, and options carry a full one-year warranty from the date of purchase.

New boxed quipment that has been on the shelf for a while may still have the old "90 day" warranty card. But, all you seem to need is a dated reciept showing that the equipment was purchased on or after Oct 1,90.

Also, my strategy has been to charge my "large" purchases on a VISA that offers the "extended warranty program". Some VISA and American Express will double manufacturers warranty up to a year. So, now your new Kenwood stuff could potentially have a 2 yr warranty.

Please read the fine print on your VISA extended warranty agreements. Some require that you "register" these purchases within 30 days to take advantage of extended plan.

Gary

Well, I'm not convinced that it has no relevance to amateur TV and/or Novice training tapes, but in any event my question has been answered, and I'm grateful to all who offered suggestions.

Thanks for the info, Bob.

I must tender my most humble apologies to the ARRL. Your note was published in QST.

I'm somewhat disappointed that the various reviewers of equipment have not covered this aspect of some pieces of equipment. The RADCOM reviews combine a set of thorough measurements of the equipment's performance - compared with its specifications with a description of its use. There is no opinion of the design of the equipment, or of its life expectancy given. The UK commercial ham-radio press usually performs few or no measurements and content themselves with quoting the specifications and describing its use.

The RSGB creates the impression that it is guarding its advertising revenue by always seeming to recommend the equipment- you have to read carefully to find out what for !

Calls for an investigation into the pricing of equipment have been stone-walled over the years. G's pay roughly 1000 pounds sterling for a rig with <$1000 US price. With $1.90 ish exchange rates, some people want to know who's getting rich :-)

PS Readers of the ARRL subs increase string may be interested in the last copy of RADCOM which contained the announcement of an increase in RSGB subscriptions to 30 POUNDS (about $57) :-

_ never expected a reply from the source of that small but important note

amazed GM4ZNX !

There will be a new source for Glenn Hauser's "World of Radio" program, beginning next weekend (Nov. 25-26, 1990):

WWCR, Nashville, TN on 7520 kHz, UTC Mondays at 0130 (That is 7:30 PM Central Time).

This should offer an improved signal compared with the problems that have been affecting WRNO in recent months. (Does anyone know the source of that fax [?] transmission that is constantly interfering with WRNO on 7355 kHz? Would someone blow up that interfering transmitter, please? :-)

Glenn hopes that another broadcast can be added on WWCR during the day, when it is on 15690 kHz, but there is nothing definite yet on that.

By the way, due to some strange mailer situation, I have not received any

SWL or ham list mail for some days now. I think this message will get out to the lists OK, though. But I may not see any followups until the list mail starts flowing in here again.

Regards, Will Martin

Me, too, but what good is it if everyone does multiple posts? With RARE exceptions the only time I post an article in two or more newsgroups is in reply to someone else who did (and I'm therefore uncertain which one he's actually reading). But some people do it habitually. That would tend to defeat the purpose.

When we say rec.ham-radio.legal, are we including tower cases, etc., or only FCC regulatory matters? If the latter, then rec.ham-radio.fcc might be more descriptive.

Right. Guys in Chicago in the Good Old Days would kill to get Gould to slip
their ham callsigns into the Dick Tracy comic strip, which he did regularly.

Hmm, that's a point I hadn't considered. But when you're stalking a toddler, it's rather like combat photography. The amazing thing is you get it done at all. [:-)

>Check out the library! Even the Handbook has some info on DSP.

A good book on the math behind what Brian has described is "Signals and Systems", by Oppenheim and Willsky. Prentice Hall. If you really want your mind bent "Digital Signal Processing", by Oppenheim and Schafer, Prentice Hall, has been the basic text for the past decade. There are newer texts out today and they are coming out faster now that the field is heating up. Be prepared for some heavy math-o-matiks if you get into the theory but as hardware comes on line cookbook solutions for the Amateur will become more available.

I'm completely in favour of getting the unproductive stuff out, but I feel a 'serious' topic name will attract enough useful stuff (such as the recent postings about US covenant restrictions) to warrant reading - so I'll still end up wading through pages of flames.

What about alt.religion.ham-radio as an alternative (or even additional) group ?

Smart move Gary!

I have been using my American Express for just this reason. I called
American Express and no registration is required. My 950 has a 2 year
warranty!
Not bad for a small annual fee...

But of course! 'Stranded in Iowa', by Manfred Mann('s Earth Band). I do not
know which album that this track is on. It was a fairly popular request
on the local rock FM plant in Des Moines while I was at Ames attending
Iowa State. I had heard it played in Illinois sometime in the late 70's,
so that gives you some idea of the vintage.

I have no idea what the story is on this track, whether the group had
an ugly lay-over in Iowa, or just through a dart on the map. I have
even less insight as to why it has the morse and radio sounds. Perhaps
someone with the album would have some background.

Interesting to have that tidbit dredged up from the past.

I posted something a while back about the sexist wording on the WAZ
certificates, and said that I would write to the current award manager,
K1MEM. I just had a letter from him, and he says that when the current
stock of certificates is used, they will be re-wording the next batch.

I was disappointed that my posting had such a negative reception here.

Most of the responses were "his includes his and hers", "how trivial" and so on. The point I was trying to make was a deeper one than the wording on a particular certificate. We have people on the net who insist that we need to increase the number of hams by a large factor, and yet most of the current hams seem to have this pro-male attitude about the hobby. Without changing the current licensing structure, we would roughly double the number of hams if we recruited one female ham for each male. I never have to use male-only parts of my anatomy to operate the radio on any mode (experiences to the contrary should be sent to rec.sex or wherever), and don't understand why there aren't more female hams (well, I do, it's connected with the "girls can't and shouldn't do technical things, they should stay at home sewing" attitude that is still with us). So perhaps the responses to the posting were what I should have expected. I think it's a pretty sad situation.

I constructed a 1/4 wave 2m antenna from a cheap TV dipole. I used the type that comes with the TV, the type that attaches to the back of the TV. The whips are telescoping, and can be swiveled 180 degrees. I removed the

300 ohm twin-lead, and mounted a BNC connector directly to the mounting screws for the two whips. I carry a 6 foot length of RG-58 with BNC at both ends. I have attached a 19 inch length of fishing line to the base. I use this for measuring the length of the extended whips. I use clear plastic suction cups to attach the whole thing to a window. Only 2 suction cups will do just fine.

Some other drawbacks are shorter recording time for the 8mm camcorders due to the smaller tapes.
Also, if you want to play 8mm tapes back through your VCR using VHS tapes, you must record the 8mm onto VHS tapes. This naturally reduces the quality of the final playback due to the addition of noise.
I think the rule of thumb is that every cope of a copy will have twice the

noise in it so that a copy of the orginal will have twice the noise of the orginal making it look much grainer or fuzzy.

>Does the ic751a have the battery backed-up RAM microcode as does the
>ic751?

Icom has fixed this problem in the 751a. Recently I went looking to buy
a new hf radio. The 751a was considered, and in Icom's sales literature
I noticed that they explicitly stated that the microprocessor code is
"permanent". The 751a was a little pricey so I bought the TS-440 instead.
Funny thing; I was asking my brother for his opinion, and he brought up
the issue about battery backed program code. I didn't know about it until
then, and assumed that all the radios had their code in eprom.

I am looking for any information about the SARSAT search and rescue

satellites. I know that they are low orbiting birds that listen to 121.5 and

243.0mhz. They are listening for elt signals. I know that they, with a ground

station can pinpoint downed aircraft by listening to the elt. What is the

downlink frequency used by SARSAT? What form of modulation does it use? Is

any onboard data processing taking place on the birds? If so what kind? What

kind of equipment is used at the ground stations? What type of signals do the

birds send to the ground? Are they the output of the rcprs listening on 121.5

and 243.0? Or is it sum kind of data from an onboard computer? Any information

would be appreciated.

I've been running a 80M full wave loop (inspired by the same QST article) for about a year now and while I really don't have a lot of data (used only once a week for a sched on 20M) it has been a very satisfactory antenna for me. Mine is very close to a square with two ends supported by the far ends of the house and the other two by poles in the back yard. Height ranges from 25' to 20'.

Please Note:

There has been quite an influx of requests for the document "Understanding Solar Terrestrial Reports." To all those who sent in requests, please note that this document is still being prepared and is not yet ready for circulation. It will be sent to each of you as soon as it is finished. Please be patient.

To all others who are unaware, this fairly extensive document will aid in explaining the reports, alerts and warnings which are posted over the networks. It will also discuss techniques and procedures which can be used to extract information potentially useful to your field of interest. The document concentrates most heavily on radio communications, although there is relevance and reference to other fields of interest (ie. astronomical observations, telecommunications, electrical power generation, atmospheric circulation, etc.). If interested, send requests for this document to "std_oler@hg.uleth.ca". It will be e-mailed to all who request it, when completed.

/\

-- MAJOR SOLAR FLARE ALERT --

NOVEMBER 27, 1990

Potential Impact Forecast
Flare Event Summary

MAJOR ENERGETIC EVENT SUMMARY

The first major solar flare since 20 October erupted from departing Region 6368 (N18W90) at 23:17 UT on 26 November. The flare attained an X-ray class M7.5 rating, but remained only a category 1N optical flare. It began at 23:12 UT, peaked in intensity at 23:17 UT and ended at 23:29 UT. This impulsive flare lasted 17 minutes, which is rather short for a flare of this x-ray intensity. Some minor discrete radio emissions were detected, along with a suspected minor intensity SWF/SID along the sunlit portions of the hemisphere.

Region 6368 will cross the west limb late on 27 November and will not reappear (assuming it does not die) until near 11 December. It continues to sport a complex Beta-Gamma-Delta configuration with persisting magnetic complexity in the trailing spot group, which has become quite difficult to resolve optically.

Region 6377 (S04W29 at 24:00 UT on 26 November) continues to grow in size and has produced eight subflares over the past 24 hours. It is expected to be a frequent source for C-class flares and subflares with a risk for occassional (albeit, less frequent) M-class flaring.

The Space Environment Services Center has restored the potential PCA alert status to a condition GREEN level, with the passage of Region 6368 beyond the west limb. Flare probabilities for the next 72 hours (ending 29 November) follow:

Flare Type	Probability 24hr	48hr	72hr
Class M Flare	60%	40%	40%
Class X Flare	10%	02%	02%
Proton Flare	02%	02%	01%

Overall flare activity will subside as Region 6368 crosses the west limb. Region 6377 will continue to provide frequent C-class flares and subflares, although M-class flare activity should drop noticably over the next three days, provided no new hot spots rotate into view on the eastern limb.

POTENTIAL TERRESTRIAL IMPACT FORECAST

Todays major solar flare is not expected to have a terrestrial impact. It was too distant (on the west limb) and was not physically large enough to affect the earth from our position. Hence, the predictions and charts which were posted in the Solar Terrestrial Forecast and Review still apply and are not expected to be affected by this major flare.

Geomagnetic and auroral activity has increased as expected over the past 24 hours. Currently, unsettled conditions are in progress with occassional brief bursts of active conditions. Auroral activity has remained confined to the auroral regions, but has degraded signal quality over many middle latitude

regions. Conditions are expected to return to quiet to unsettled levels by
29 November, in close agreement with the prediction models previously posted.

Thanks for all the answers I got to my post, guys (and gals). I think that my train mobile op is shaping up to look pretty good. I've got 110 VAC available (from the outlet), but I'll probably be using battery and switching them back and forth. As for an antenna, I think at the moment I will try something along the lines of what the first STS amateur experiment did (dipole made out of 14 gauge taped to the window, running into coax terminating in a BNC). That seems fairly foolproof. 19 inches seems to be the going rate on length, so I should find it all fairly easy to fabricate. This antenna seems to be the best comprimise I could find tween "easy to carry" and "best signal". Someone mentioned a j-pole somewhere on here, but my mailer chewed it up on me. Could someone send that to me again? (privately, please).

Well,back to the books.

(as everyone breathes a sigh of relief after reading a post that had no political statement in it)

73's for now,

Todd Perry, KB2JAC/9

Joe, (and other outlaws who own those dangerous radar detectors)

I was recently stopped by a State Police in the state of CT. I was not speeding (60 mph max).

The officer said that he noticed "lights" flashing when he hit me with the radar and he wanted to know if I had a radar detector and did I know that they were illegal in CT.

I explained to the officer that I did indeed have a radar detector and that I did know that they were illegal, however . . .
I wasn't using the radar detector to allow me to exceed the speed limit as he noted I wasn't speeding. I explained that I am an amateur radio operator and simply monitor the portion of the rf spectrum used by law enforcement radar so that when such a signal is detected I refrain from transmitting. Even though my equipment is carefully kept within emission standards there may be a chance that the law enforcement equipment might be sensitive to one or more of my transmissions and I wouldn't want to make their job of law enforcement any more difficult than it already is.

The officer thanked me for my considerations, smiled, asked a few more questions. and we parted company (still friends).

Please note that I don't advocate violations of the law,
Nor would I hide behind my Ham ticked if I was quilty.
I simply wasn't speeding. Please don't ever ever ever use this reason for radar detector possession if you have been clocked at above the posted speed limit. Such an irresponsible action would only serve to bring discredit on the amateur community.

Fred, I lived in Kingman, Arizona for a little over a year and enjoyed the heck out of the 146.76 repeater there. It was at 8500' in the Hualapai Mountains and we had regulars from Orange County check in with 40' towers and 11 element Cushcrafts. That is a crow-flies distance of about 275 miles. It had great talkie coverage all over NW Arizona.

I'm in need of antenna guru advice.

I am putting up a Zepp antenna cut for 7.1 MHz. The ARRL Handbook says that such an antenna fed with balanced line will operate at all frequencies above what it is cut for. It also says that the feed line should drop perpendicularly away from the antenna for at least a quarter wavelength. My question is what to do with it after that. I know it needs to go into my transmatch, but after it drops a quarter-wavelength, it is down at ground level (I could only get the dipole about 35 feet in the air). My rig is on the second floor of the house. Now, do I just turn the balanced line around, go back up in the air, under the window, across the room, and to the transmatch? Or do I make a balun of some sort to a coax transition at ground level and then handle the coax from there on as usual (i.e., running it anywhere I can get it through the house walls). There is a well-advertised commercial antenna (is it a G5RB dipole or something like that?) that drops balanced line for quite a way into a "black box" with coax out. What sort of a balun is that? Never having used balanced line before, I'm a little uncertain of what I can do with it, namely where I can run it, what kind of corners I can turn, etc. (As a starter, I'm using that real wide stuff that looks like TV twin lead with alternating patches of the center plastic cut out. After I learn to handle that, I though I would look for some of the open wire with discrete spacers.) Having only used coax feed for 33 years, I thought it was time to learn balanced line.

I have uploaded to SIMTEL20:

pd1:<msdos.hamradio>
HC901204.ZIP   HamComm: Transmit/receive RTTY with PC/XT/AT

HamComm currently allows for transmission and reception of amateur teletype signals. The interesting thing about it is, that it doesn't require a modem. The audio output of the transceiver is connected to a serial port of any PC/XT/AT compatible computer thru a very simple and low-cost circuit. You need only one ic (op-amp LM741) and a few diodes, capacitors and resistors. For transmission the speaker output is connected to the microphone input of the transceiver thru a passive r/c filter. Estimated cost is about 10$. Audio frequency decoding and serial/parallel conversion is all done by the program.

HamComm will run on XT maschines but the graphics display of the input signal is more fun to watch on an AT-class maschine. Nearly all of the functions can also be controlled by using a mouse. The program automatically detects the type of display adapter in use. MDA, CGA, EGA, VGA and Hercules are currently supported. A harddisk is not required. All text are written in english and the online help function includes the schematics for the interface circuit. There are also predefined standard phrases and ...

Sorry, i got carried away :-)

best regards.

If you know about the Mt Lemmon repeater, you should surely be familiar with the Kingman machine. Once you get away from Lemmons shadow, you can talk to LA and Las Vegas through it. There are also some great coverage repeaters in the central Colorado area, up around Cheyenne, and over in the western Montana area. Oregon has a few nice ones, too, including a wind/solar powered repeater *very* high on Mt Hood which covers about two thirds of Oregon and a goodly portion of southern Washington. I have read of repeaters on the East Coast, I believe in the NH area that have 150+ miles of radius.

Mountaintops can be great!

Now talk about a super (depending on whose opinion you ask) repeater/linking system, can somebody provide any technical descriptions of some of the railroad systems (BN and UP) across the Dakotas, Wyoming, Montana, etc? On one channel, 160.???, I could hear the same maintenance crews, trains, dispatchers, etc, for several hundred miles and I know it wasn't all from the same transmitter.

73,
Michael

Communications needs vary. I go 4 wheeling quite often. When I go with
other vehicles, I have two CB rigs (besides the one in my jeep) I loan out
so that as many vehicles as possible can communicate. CB is cheap and

effective for that application.
On the other hand, if one needed to summon medical assistance via
phone patch, it's probably a better bet that you'll find a 2m repeater to
get help. You might have to drive to some point for line of sight but
it's likely to be more effective to do that than to try Channel 9.

My most difficult radio +driving task was when I led a caravan where 5
vehicles had CB and 1 had 2m. Operating 2 radios and driving a 4WD
road at the same time was interesting.
(I later rescued that ham from a 4WD breakdown that he called me
about via phone patch from 75 miles away :-)

CB is not useless but it's not the entire answer. Neither is 2m FM.

Sometimes a raised middle finger is the simplest, most effective
mode of communications :-))))

How about W2IBJ??   Freq = 29.66 (-100)
Covers all of the US, the Caribean, South America and probably Europe and
Africa too.
Comes up about 0730 EST and goes off about 12 hours later. I guess they
don't have much in the line of commercial power there.

:-)

Many foriegn cards are larger than the 'standard' US cards. The larger foriegn cards seem to go thru the bureau just fine. However, for people like me who send a SASE to a stateside manager or individual, your card will not fit in the SASE I use stateside. For foriegn SAE's I use the European sized envelope.

The multiple-sections-of-coax antenna sounds like one that has been written up in ARRL antenna handbooks for a number of years. Dunno if it's still in the latest one. I don't have the numbers handy, but did build one and found the feedpoint impedance to be about twice what it was supposed to be... In spite of that, the antenna seemed to work OK, though I never did any quantitative gain measurements on it.

>
> shaded, I would guess that 15,000 is not unlikely with this machine. This area does not include the other machines in the ZIA link which are conected to the 715 machine (a good story by itself).
>
> Which other machines around the contry or the world are in this category? Which machine do you think would rank as the worlds largest in terms of coverage area?

Well, if you count 10 meter repeaters then in theory any one of them would rank as worlwide coverage. I have worked Europe, Japan, S. America as well as most of North America through 10 meter a repeater here. Of course I was on 440 at the time so maybe that doesn't count for your contest....

And 100 miles given that kind of altitude isn't spectacular. I can work the Wachusset Mt 440 repeater (about 2000') while hiking in the White Mountains (about 4000') with an HT. I don't have a map in front of me but I would guess about 100 miles there.

I am sure people will come in with some good stories on this thread...

A recent mishap has been plaguing the Club activities here
Our packet cluster went down
Also one of the computer clusters also went down
As it stands skeds must be made to an alternate address on Internet or Bitnet
or on 10m during your contact. Hopefully the packet cluster will be up
very soon as well as the computer cluster.
At any rate, make skeds to

WWVB references
----

1. "A WWVB 60 kHz Frequency Comparator Receiver" by Ernest P. Manly,

_73_ Magazine, Sept. 1972. The now-obsolete RTL integrated circuits in this design can probably be replaced with CMOS. It's similar in function to the Hewlett-Packard 117A VLF Comparator but has no phase-locked oscillator output.

2. Don Lancaster published plans for a 60-kHz WWVB receiver with time-code output, in _Radio-Electronics_, August 1973, p. 48. Methods of phase-locking are discussed. This article tells how to decode the WWVB time format, and includes a signal-strength map. I had trouble receiving WWVB here in Indiana until I got a Burhans voltage-probe VLF preamp and Burhans VLF converter. Now it's one of the strongest signals on VLF. Previously, I used a Palomar Engineering VLF converter, which is worthless by comparison. The main receiver is an Icom IC-720. Sometimes I must run everything on battery to eliminate line noise.

3. "Low-Frequency Receiving Techniques," a series of articles by R. W. Burhans in _Radio-Electronics_, March-July 1983, describes LF/VLF active antennas, and a method for using LORAN-C (100 kHz) for time and frequency calibration. A set of reprints, with errata/addenda, is available from the author for $4.00:

Burhans Electronics
161 Grosvenor St.
Athens, Ohio 45701

Send SASE for catalog. See also Prof. Burhans' three-part article about Omega navigation receivers (10-14 kHz) in _Byte_ magazine, February, March, April, 1977.

Hmmm. The 'Zia Connection' is a series of 11 or so repeaters that covers from eastern California, most of Arizona and NM, and parts of west Texas.

To your original question, there are several repeaters here in NM that would qualify as wide area machines. Mt Taylor and the Sandia Peak machines are both over 10,500 ft elevation, and cover hundreds (thousands?) of square miles.

While travling in New Mexico I saw a repeater site.

At the top of Sandia Crest elevation 10,678'.

This mountain rises above the desert and I mean the land is completely flat for miles and miles and miles . . . .

Nice coverage.

There are two repeaters listed in the repeater book for this location.

implementation of routing algorithms for packet radio networks.

I need to build a test bed to study the performance of the proposed landmark routing algorithms.

I need to get in touch with local groups in the state of Maryland especially Baltimore. I also need to become a certified operator.

Any useful information would be appreciated.

Thank you in advance.

Issued: 19:00 UT, 27 November

Geomagnetic Storm Alert
Auroral Storm Warning
Revised Forecasts

Attention:

The effects from a coronal hole are having a stronger impact than was expected. The geomagnetic field hit major storm levels over middle latitudes between 15 UT and 18 UT on 27 November. This burst of activity follows a period of unsettled to active conditions which has lasted approximately 20 hours (as of 19:00 UT on 27 November). Predominantly active to minor storming has occurred in the higher latitudes over the past 6 hours.

The geomagnetic field is expected to range between active levels and minor to major storm levels over the next 24 hours. Regions which will be affected most severely will be the higher latitudes and northern middle latitudes. High latitudes may experience bursts of major storming, particularly during the evening and local midnight periods. Middle latitudes will likewise experience potential minor storming between the evening and midnight periods. Activity should peak between local midnight and near 3 am local time (ie. in your local time zone).

The geomagnetic activity A-index for Boulder reached 35 at 18:00 UT, which is within the lower bounds for a minor storm. Activity near the 50th parrallel is estimated at an A-index of near 38. The storm will be monitored closely. Activity should subside by 29 November.

An Auroral Storm Warning has been issued for the high latitude regions. An alert to the potential for auroral storming has been issued for middle latitude regions. Auroral activity on the evening of 27 November may become quite strong over middle latitudes. Low latitudes may be able to spot diffuse auroral glows far to the north. The auroral zone has expanded southward slightly over the past six hours. No significant southward expansion is anticipated. Reports of any observed auroral activity from low latitudes would be appreciated.

HF radio propagation will be poor during the local evening and midnight hours on 27 November. Signficant amounts of auroral flutter and fading will affect middle and high latitudes. Low latitudes will also experience noise and fading, particularly over northerly paths.

There is a fair possibility for some potential auroral backscatter communications over VHF frequencies near sunset and later tonight (near local midnight on 27/28 November). Area's most susceptible to auroral backscatter communications are the northerly middle latitudes, although middle and southern middle latitudes may also experience periods of backscattering. Signals on backscattered paths will be quite poor, with significant amounts of sputter. CW communications should prove most reliable over potential backscatter paths.

The following forecast charts have been modified to reflect the recent increased geomagnetic and auroral activity:

NOTES:

These VHF DX prediction charts are defined for the 50 MHz to 220 MHz bands. They are based primarily on phenomena which can affect VHF DX propagation globally. They should be used only as a guide to potential DX conditions on VHF bands. Latitudinal boundaries are the same as those for the HF predictions charts. For more information, request the document "Understanding Solar Terrestrial Reports" from: "std_oler@hg.uleth.ca".

Does anyone have a reference or clues to same for a 60 KHz WWVB receiver design? I'd like to play with such an animal as well as antennas for VLF. Are there any designs for active VLF whip antennas (like those used for LORAN on boats) floating around?

Any info would be appreciated. Thanks!

Chris

Hi,

Time to call on all you experts out there. I have come across a vendor selling a wireless lan which operates on the 902-928 MHZ frequencies under low power, unlicensed.

I was wondering (since I don't have my allocation chart handy) if anyone knew if this range is allocated to a ham band ? Someone elses use ? A joint assignment ???

Any and all information regarding these frequencies would be most helpful.

```
     Thanks in advance!

Yes, radar decectors are illegal in Virginia, and also in Conneticut
(sp?).  These are the only 2 states that I know of which ban these,
but I guess they could stretch the monitor law in New Jersey? :-)

I see!!! The way you learned things is the ONLY way to learn things. If you are so sure there is a crime there, you have the authority to look into it and see that JUSTICE is done. Think back Joe to your learning days. When you learned it, I'll bet that you didn't really take more than the 20 hours stated. And did it ever occur to you that maybe...Just maybe, these folks are actually learning to pass the course. I congratulate you on being and old fart as I am, but I think that you are way off base here, unless you can prove somehow that this guy is really cheating somehow. As far as your crime comparisons....Are you from the real world or do you really beleive that gun control, and crime prevention are really on the same level criminally as this suspected crime.

In fact, there are questions in the Extra pool dealing with just that - no "educator" can give tests. That would be a conflict-of-interest. Looks like I'm gonna have to pull out that Rulebook and quote the section, if somebody doesn't beat me to it.

PROPAGATION FORECAST BULLETIN 48 ARLP048
FROM ED TILTON, W1HDQ
SPRING HILL FL NOVEMBER 26, 1990
TO ALL RADIO AMATEURS

THE SOLAR FLUX STARTED AT 145 IN NOVEMBER, DIPPING TO 140 ON THE SECOND DAY. THE CURVE THEN TURNED UPWARD, REACHING 215 ON THE 8TH. THEN FOLLOWED TEN DAYS OF UPS AND DOWNS, THE FLUX DROPPING TO 186 ON THE 18TH AND THEN RISING TO WHAT WILL PROBABLY BE THE NOVEMBER HIGH, 223, ON THE 17TH. IT WAS ALL DOWNHILL THEREAFTER, THE FLUX DROPPING TO 167 BY THE 25TH.

THE TWO LARGE SPOT GROUPS THAT PROBABLY WERE THE PRINCIPAL SOURCE OF ENERGY THAT BROUGHT THE SOLAR FLUX UP TO 223 WERE DISAPPEARING AROUND THE WESTERN EDGE OF THE SUN OVER THE WEEKEND. THERE ARE SMALLER GROUPS STILL IN VIEW, AND SOME NEW ACTIVITY WAS JUST VISIBLE ON THE EASTERN EDGE SUNDAY AFTERNOON.

EVERYTHING VISIBLE OVER THE WEEKEND APPEARS TO BE SMALLER THAN WOULD BE REQUIRED FOR ANY LARGE INCREASE IN THE SOLAR FLUX THIS WEEK. ON THE OTHER HAND, THIS IS THE BEST TIME OF YEAR FOR NEARLY WORLDWIDE COVERAGE ON 28 MHZ AND POSSIBLY EVEN 50 MHZ. CHECK WWV BULLETINS AT 18 MINUTES PAST THE HOUR FOR THE LATEST INFORMATION ON THE SOLAR FLUX LEVEL.

THERE WAS NO AMERICAN SUNSPOT NUMBER REPORT PHONED IN THIS WEEK. CHECK NEXT WEEK'S BULLETIN FOR THIS DATA. SOLAR FLUX NUMBERS AS REPORTED BY WWV FOR NOVEMBER 15 THROUGH 21 WERE 212, 210, 223, 203, 196, 190 AND 182, WITH A MEAN FIGURE OF 202.3.

most VLF receiver system antennas are really just a large loading coil connected to a smaller (electrically very short) antenna. Loran receivers on boats use small whips which add little to the antenna performance. The ferrite loading coil probably contributes as much or more then the small whips (look inside any AM transistor radio, the antenna is just a ferrite rod).

The handbook has some discussions of LF antennas. One I have used very successfully in a small space was a bicycle tire rim wrapped with several hundred turns of #38 wire (the rim is strictly a coil form). This worked well for reception down to 10 khz. I used this to monitor meteror hits on the earths atmosphere. For Loran reception at 100 khz I have been quite successful with 4" ferrite rods resonated to 100 khz. Of course Loran is a very powerful signal.

Good luck.

Brian Boschma.

Perhaps this is as useful: contact

X3 Secretariat,
Computer and Business Equipment Manufacturers Assoc.,
311 First Street NW, Suite 500,
Washington, DC 20001-2178

Attn: JPEG Draft Technical Specification

Ph: (202) 737-8888, Fax: (202) 638-4922

The document, for review and comment, is available for $8.

For a very short paper on JPEG, you might look at

Wallace, Gregory, K., "Overview of the JPEG (ISO/CCITT)
Still Image Compression Standard"

The copy I have is a preprint that states that it was
to be published in the 1990 SPIE/SPSE Symposium on
Electronic Imaging Science and Technologies, Feb. 1990,

Santa Clara.

The paper includes references to other pertinent material. Oddly enough, it did not reference Pratt's "Digital Image Processing," where you will find early work on the discrete Cosine Transform.

The SARSAT project was managed by Goddard Space Center, however, there is no longer a listing in the current (10/90) or previous (4/90) internal phonebooks for the SARSAT project manager. This means the project is no longer operational or that management has been transfered to another agency. You could try the GSFC Public Affairs Office (301-286-6255) or possibly NOAA.

Sorry I can't be more help.

Rather than going to a QSL printer, I did some desktop publishing and took my QSL art to a copy shop. They did a good job except they made the cards 4 x 5.5 rather than 3.5 by 5.5. They defended their decision since the cards still fall in post office spec.

I am afraid that they won't go through the QSL Bureau if they won't fit in their sorting systems and envelopes. Can anyone confirm or deny this?

The copy shop will redo them if I insist, but I have to redo the artwork -they say they need more white space top and bottom to guarantee the cut. I think the art could fit fine in 3.5 inches and think they're wimping out.

Anyway, I need to know if the cards are actually too big for the "sorting and forwarding service" that I told the copy shop was involved. Anyone know for sure?

I think in practice the deviation from spherical is nearly irrelevant.
Certainly for aiming antennas! Also over "short" distances on the order
of hundreds of miles.

Across the USA there are hundreds of VLF aircraft navigation beacons know as NDB's (non-directional beacons). They operate in the 200 KHz to 400 Khz range.

Does anybody know what output power NDB's utilize? I can hear the CW identifier from them as much as 200 miles away and I am trying to determine whether this is excellent reception or just typical. My antenna is a homemade 'active' whip which is about 10 feet long. I was told that NDB's are low power in order to minimize interference between beacons operating on the same frequency in different geographical locations.

Knowing the answer to this question will help me determine the effectivness of my active VLF whip. WWVB comes in so-so at 60 KHz.

Thanks in advance,
Charlie WB4HVD

This may or may not be of interest to people, but in addition to the shuttle status reports posted to this group, there are "Shuttle Status" (ss), "Payload Status" (ps), "Launch Advisories" (la), "Headline News", etc available on ames.arc.nasa.gov (128.102.18.3) via ftp. The are in a directory pub/SPACE and are in files such as ss11.26.90 (which means shuttle status for 11/26/90). There are so many files in this directory that doing an ls or directory isn't practical, but doing a

dir ss11* will give all Nov files for this and past years. The availability of the reports is not allways reliable, probably due to how busy the individual who posts them is. For the last three launches there was a flurry of reports up thru a few days before the launch, and then nothing. I'm not sure if the ametuer radio efforts are followed in the ps series or not, I've only read a few. An example of a recent ss file (ss11.26.90) follows.

****

Monday November 26, 1990 10:00 a.m. EST

KSC SPACE SHUTTLE PROCESSING STATUS REPORT

STS-35 -- Columbia (OV 102) - Pad 39-B

Work continued over the weekend on the shuttle Columbia for mission STS-35. A scheduled replacement of an APU gaseous nitrogen line quick disconnect was completed on Saturday. Sunday, the pad was closed for ordnance operations. Today, technicians will begin operations to pressurize the hypergolic tanks in the OMS pods. Work in the aft compartment will continue once the pad is open after completion of hypergolic operations today. Aft operations are scheduled to be completed Wednesday.

The payload bay doors will be opened later this evening and final servicing of the BBXRT payload is scheduled for Wednesday.

A target launch date for mission STS-35 and the ASTRO-1 observatory is expected to be announced following the Delta Flight Readiness Review. The FRR is scheduled to begin at 8:00 a.m. tomorrow in the Operations and Checkout Building's mission briefing room.

STS-39 -- Discovery (OV 103) - OPF Bay 1

Ammonia boiler freon loop decay checks were performed over the weekend on the orbiter Discovery in the Orbiter Processing Facility. Bubble soap leak checks were conducted with several leaks identified near the cold plate manifold. Work will continue today to replaced the cold plate manifold seals.

X-rays of the orbiter body flap have been completed and routine work on the wheels and tires will continue today.

STS-37 -- Atlantis (OV-104) - OPF Bay 2

Normal post-flight safing operations are continuing today on Atlantis in the Orbiter Processing Facility. Cryogenic drain operations were completed last Friday and the thruster plugs have been installed on the vehicle. The payload bay door strong backs are being installed today and the doors are scheduled to be opened tomorrow.

****

an example of a payload status (ps11.13.90) follows.

****

Daily Status/KSC Payload Management and Operations 11-13-90.

- STS-35 ASTRO-1/BBXRT (at Pad-B)

Experiment monitoring continues.

- STS-39 AFP-675/IBSS/STP-01 (at CCAFS)

CITE preps continue at the VPF. STP-01 will arrive at CCAFS today.

- STS-40 SLS-1 (at O&C)

Power on IPR/PR troubleshooting will be performed today. CITE closeout operations continue.

- STS-37 GRO (at PHSF)

No work is scheduled for today.

- STS-42 IML-1 (at O&C)

Module staging will be active today.

- STS-45 Atlas-1 (at O&C)

Experiment and pallet staging continue.

- STS-46 TSS-1 (at O&C)

Power on systems testing continues.

- STS-47 Spacelab-J (at O&C)

Rack staging will work today. Also the SREM will be
unloaded.

- STS-67 LITE (at O&C)

Pallet staging will be active today.

- HST M&R (at O&C)

Preps for the transportation of the pallet to GSFC will be
active today.

My work colleague, KE9ZM, used a Mac and Pixel Paint to do a rather wild QSL
card to use for his mobile contacts. He printed those on a Laserwriter
using postcard weight card. They are very nice (altho quite yellow).

Observing his production of the card, I seemed to recall that someone on the net generated cards using postscript. If my recollection is correct, I would appreciate corresponding with that person with the possibility of receiving the postscript commands.

Thanks.

Thank you for sharing that with us. Unfortunately, it has nothing to do with the topic we were discussing. The segment you quote relates to a third-party DIRECTLY manipulating the amateur stations' on-the-air transmissions in real time. We are discussing non-realtime "store and forward" transmission of Internet newsgroups. In such a matter nothing is said about the mechanics of ensuring compliance with rules governing message content. There is no reason to assume, based on anything in Part 97, that a licensee or his designated control operator may not legally employ mechanical aids to enhance his ability to achieve that compliance with a minimum of physical labor.

November 27, 1990

WLIO Television has an opening for a Television Maintenance Technician. The applicant must have basic electronic skills as well as knowledge in broadcast television equipment operation and repair

The applicant will be responsible for maintaining video and audio systems, including audio tape cartridge and 3/4" U-matic tape, (soon to switch to M-II), and associated equipment in television broadcasting.

The applicant must also have RF knowledge on UHF Television Transmitters, UHF 2-way, 2 gHz microwave/ENG truck, and general transmission techniques. Computer knowledge and certification in radio service is preferred.

This position is full time with all normal benefits. All applicants to this position should contact Frederick R. Vobbe, Chief Engineer of WLIO Television, P.O. Box 1689, Lima, Ohio 45802. WLIO Television is an equal opportunity employer.

Frederick R. Vobbe, Chief Engineer WLIO(TV)

--- TBBS v2.1/NM

Actually they do have software. In fact the interface commands are

detailed in the manual. The IBM version cost $10. AES stocks it.

G3-5 just went VC II+ ---> Cable Video Store

Has anyone figured out how to get a VC II to receive VC II+ datagrams.

Has anyone 'fixed' a VC II+?

In Canada this is legal. Therefore, if you are from U.S., don't send
nasty-grams to me.

You didn't mention what frequencies you're using? If you're talking the Ham Bands (I assume) then you're in violation of FCC Regulations using the repeater for business uses! If you are talking Business use frequencies, then you will have to talk to someone in the know at your local FCC office.

In article <9011261526.AA12053@lonexc.radc.af.mil> szarekw@LONEX.RADC.AF.MIL (William J. Szarek) writes:
{
{I am back with the results from my battle with alinco. For those who have
{seen this before and are familiar with my quest the new info is on the last
{page of this posting. For those who are not familiar read on. For those
{who don't care oh well . . . .

I also bought one of these and care very much! I agree with your assesment of the rig BTW, it is a good buy despite the deficiencies. THe detachable control head should be a really neat feature if I ever get it installed in my car (it was installed for a day and then the UHF started to howl with the volume up high - now waiting on warranty repair!)

{If you ask them (nicely) there are (a few) dudes at Alinco that are willing
{to help and are smart enought to be helpfull (there is a differance ;-}).
{They can fax you the information or even send it to you next day air at no
{charge if you ask politely or are VERY persistant (as in my case).

I have found their staff very willing to help, but lacking in support from
head office. Like the $10 service manual that still hasn't appeared - I
would really love to get a copy!

{Now the big news . . . to modify the rig to xmit out of band (to call the
{cops etc ;-}), to operate as a cross band remote, etc. follow these easy
{steps.

[modification steps deleted]

{This is what you will find . . .
{The rig now transmits everywhere.

This I do NOT consider a virtue, if I want to transmit out of band I want
to KNOW that I am doing it! I have caught myself twice now replying to a
VHF repeater on the UHF state police frequency. They use PL and I cought it
after getting only "Alpha Alpha OOOPS" out, but that is still not something
I like to do! All to easy in city traffic though.

{it now will display (not receive) 800Mhz band and 300Mhz band on the 440
{side of the display in rotation (press the uhf switch to switch from band
{to band)
{It will now display (not recieve) the aircraft band (yes it does indicate
{AM) on the 2 meter side of the rig. There is no AM detector presently but
{I am working on it.

I would love to see this whenever you figure it out. My ICOM 24AT actually
DOES receive ALL of these, so it should be doable. Transmit probably WON'T
work, but that's really not something I want (see above).

{Cross band operation:

I too plan to get a 45 Watt handhel this way. Only problem is that you
can't transmit until the repeater/other station drops their carrier. There
is no way (that I know of) to disable the full duplex!

Personally I find the handheld receiver works fine and would like to have
just a ONE WAY (VHF to UHF or UHF to VHF) as an option.

I find this is annoying with the dual band function too, it would be nice
to have the option to AUTOMATICALLY mute the "other" receiver. It can be
done mmanually, but I have other things to do on the freeway. ("FIRST fly
the plane/drive the car!")

{I am a bit miffed that Alinco didn't see this through. They could have created
{the all time worlds greatest mobile rig that would allow one to access it
{via 440 and then work any of your favorite 2 meter repeters operating as
{a remote base.

I agree, but hopefully hams can find mods/methods to accomplish 99% of
these.

{They even saw fit include a dtmf function that allows you

{to remote key the transmitter (rather than running as a repeater). This
{in conjunction with the other functions that are 1/2 implemented certainly
{say something about Alinco.

Is this the "remote base" function that I mentioned above?

{Counter point
{It is still a great radio and I would buy it again still knowing what I know
{now. The only differance is that I wouldn't be as disappointed when I found
{out that the rig doesn't "really" do all that Alinco says it can do.
{
{Any way I hope you enjoy your rig as much as I enjoy mine.
{
So far I sure have! Even if I had to return it for repair. It would be nice
if they bought an IC24AT and studied the manual :-) ICOM seems to do a MUCH
better job of "thinking through" their operating procedures. Possibly this
is related to the size of the company, but ...

Any more DR590 user out there with neat ideas?

The quarter wave perpendicular drop is "ideal". Ideal and reality
are often quite different. I'd suggest running where it's convenient
keeping an eye on what's "ideal". I.E. Run it to the shack all the
way with the open line and keep it off the ground and preferably out
of your and your kids way.

If you really want to go to coax, be sure you use a very high quality
coax as you'll have high SWRs and accompanying losses on it. The quarter
wave stub matching to coax will only work well on the lowest frequency it's
cut for anyway.

My $5.00 worth is to run the ladderline the whole way, to keep it off
of the ground, and out of your way. It'll work great - mine does!

Mod number 1: I need to defeat the 2 second delay 'feature' which allows
               use of the DTMF keys without having to hold the PTT in.
               This little "feature" is a pain in the rear if one is
               trying to listen to the confirming telemetry when
               controlling links. I've heard that there is either a diode
               or resistor in the mic which gets clipped to do this but
               wud like specifics before cutting :-)

Mod number 2: Has anyone ever figured out a way to get 'sidetone'
               feedback when using the DTMF keys on this rig or similar?
               IMO audible feedback would be a very desirable feature
               when using the keypad. Especially with the crummy keys
               that are on the new mic that Kenwood sells with the 731A
               and similar sets.

Thanks in advance...

I am the Vice President of the Delta Amateur Radio Club here in Memphis, TN. We have about 300 members in our club who use our three repeaters. We have a RC-85 controller from ACC which controls our 2m and 220 linked repeater system. We have a S-com 5K controller on our 440 repeater. The main project for the coming year is to upgrade the RC-85 controller. The obvious choice was to go for a RC-850 controller. I would be interested to hear about any comments from control operators, programmers, or even users of the 850 controller. I would specially be interested in any problems, software or hardware with the RC-850.

Has anyone had any success in reducing the incredibly high amount of RF radiated from their Grappler box?

My housemate has one hooked to a Mac and the thing makes most of the frequencies in my scanner and ham equipment useless, throwing birdies out all over the place.

I tore it apart with the intent of hanging capacitors everywhere, but they actually bothered to do some filtering at the factory. I added a 0.047uF across

the output terminals of the 7805 voltage regulator
for good measure, but the source of the interference
is the execution of the on-board Z8's program.

Please email responses since my feed and my news partition
don't feel well. The clock starts ticking now; if
there is no cure, I'm tempted to Grapple the thing
into the ocean!

Ham Radio Tranceiver For Sale

One Kenwood TS-140S, HF 100W transceiver.

Excellent condition, only problem is that the hexnut on the tuner knob is stripped (a new one costs about $10 direct from Kenwood..).

This rig cost me $1100 when new, it has very little air time, and I wouldn't sell it except I am getting a new apartment and I really need the $$$.

I will accept any offer over $800.

Considering the yacht clubs with crooked VE's who pass out licenses willy nilly, I'd say those taking the West course are a real step up. I truly can't fathom why anyone would object to novice training seminars - unless it's to maintain the illusion the becoming a ham is somehow mystical and a mighty deed only a few magic people can accomplish.

Anyone out there that could kindly provide me with the address
for the info-hams digest?

Thanks,
Lee

Looking for copies of FM/RPT or a similarly named magazine from the middle
and early '70s. This is in conjunction with my Student Information Net
research. I am willing to pay mailing and/or reproduction costs. I am
particularly interested in articles related to the SIN (obviously!)

73, Paul W. Schleck, KD3FU

These are files that matched "radio" in their pathnames. There were 559
files
that matched. This is not a guarantee that the files actually are related
toham radio or shortwave radio.

(there are 559 files listed)

From: "Gray, Steven" <GRAY_S%DICKINSN.BITNET@CUNYVM.CUNY.EDU>
Subject: FOR SALE: Shure 444D and Hustler 4-BTV
To: INFO-HAMS@UCSD.EDU

I've got the following items for sale:

*** Shure Microphone model 444D; purchased 2/14/90; $45.00

*** Hustler 4-BTV Multiband Vertical; purchased 8/22/90; $70.00

Both are complete with boxes, manuals, receipts. The 4-BTV was installed on a tower for 3 weeks, and is in excellent shape. The Shure has barely been used.

BTW, the reason for the sale is that it appears I will be spending a good deal of time away from home over the next 2 years. Anybody know of a *hot* 10 meter mag-mount antenna? Doesn't Wilson make something that works well?

Thanks for reading!

In response to an article by Bob Hlivak:

Gordon West is a respected individual who happens to make a living preparing people to take amateur radio exams. His course material is available in radio stores (including Radio Shack) and through mail order.

He's done a lot to get more hams into the ranks. I owe my license to his study materials. What he's doing is both legal and ethical. I fail to understand the nature of your outrage.

SB RTTYDX @ RTTYDX $RTDX1123
RTTY DX Notes 1of3 11/23/90

RTTY DX Notes for week ending 23rd November 1990
BID: $RTDX1123
Part 1 of 3.

One wonders where the art of communications has gone to? Over the past week I have been looking at the mini mailboxes. I Saw 43 of them. Are they all small sized PK232s? It seems that with the proliferation of these units it will soon be impossible to find a space to have a QSO. I think that an original idea that was put forward would be a viable answer. All mailboxes (including mini mailboxes) be shifted to 10 and 18 MHz. That would be a logical answer. Use those frequencies, or lose them.

Our thanks this week go to DJ3IW and the Saar-Pfalz-DX-Club Packet Cluster, I5FLN, I5ICY, I5IGQ, JA1BLV, N2HOS, OD5NG, TG9VT, VK2EG, W2JGR and the Tri-State DX Packet Cluster Network. Thank you all for your very welcome information and help.

RTTY DX Notes for week ending 23rd November 1990
BID: $RTDX1123B
Part 3 of 3.

QSL Information:
```

UC2OCJ says to QSL via Box 68, Gomel. 246027 Buelrussia, USSR.

9X5LJ and 9X5AB request their cards be sent to Box 81, Kigali, Rwanda.

UH8EA collects his cards from W5BWA.

5N0ETP collects his cards via N6LQL.

9Q5TE has SM0BFJ as his QSL manager.

CE0ZZZ says to QSL to Box 13312 Santiago, Chile.

Notes of Interest:

JA3DLE/1 reports that JG1RVN will be QRV from XU for 6 days from 3rd to 9th December with lots of RTTY.

On 27th November, or around that date, (after the CW contest), N7NG, OH2BH, OH2RF, and ZS6BCR will operate from Penguin Island (off the coast of Namibia) for 6 days by special permission of the South African Nature and Conservation people. The callsign could be ZS9Z/ZS1, after which they will operate from Walvis Bay with the callsign of ZS9Z for 4 days. They will use Icom gear and the QSLS go to OH2BH.

3W3RR is still hopeful of operating from Spratley in December.

Kure Island (KH7) is scheduled for December 12-21, all bands including 6 meters, if they can find some gear and aerials for 6. If you can help, call 671-346-2201 (in Guam) after 0600Z. Prefixes may be KH7/AH7/WH7 for the prefix hunters. The basic callsign will be KD7P/NH7.

SP5FYM is headed for King George Island (Antarctica) for January 1991.

There is a plan to activate 'MV' Island (in the Gulf of Finland) in March 1991. They require RTTY gear. More later.

GL DE DX1 (VK2SG).

Written by VK2SG. Relayed via packet by Tad, KT7H @ N7HFZ.WA.USA.NA.
Send RTTY DX tips to VK2SG @ VK2AGE.AUS.AU.

To: info-hams@ucsd.edu

/\

Please Note:

A few modifications have been made to these reports. In addition to the new 20-day solar flux forecasts, new prediction charts have been added for potential VHF DX propagation. Included with the VHF DX propagation prediction charts are SID and auroral backscatter enhancement predictions charts. Comments regarding the inclusion/removal of these new features are welcomed. In order to keep the size of these reports down, some of the extraneous information has been removed.

An informational document is being prepared to aid those who are interested in understanding and using these reports in practical applications. To obtain this file, request the document "Understanding Solar Terrestrial Reports" from: "std_oler@hg.uleth.ca".

--- SOLAR TERRESTRIAL FORECAST AND REVIEW ---
November 24 to December 04, 1990

Report Based In-Part from Data Obtained from the
Space Environment Services Center
Boulder Colorado

=====---

SOLAR TERRESTRIAL REVIEW FOR 18 NOVEMBER TO 24 NOVEMBER.

Solar activity over the last week was mostly moderate. Numerous M-class flare's occurred throughout the week. Almost all of the activity was attributed to Region 6368, which dominated the disk with its large size and magnetic complexity.

Region 6368 attained a maximum size of 9,240 million square kilometers (3,610 million square miles) on 18 November, encompassing a total of 107 spots. It is a magnetically complex Beta-Gamma-Delta region. The trailer spot complex was most active and has consistently held a delta-configuration. This region was uncharacteristically inactive considering the size and magnetic complexity that it attained. No major flares occurred from this region, although warnings were issued earlier in the week regarding the potential developement of major flare activity.

Region 6368 showed signs of decay on 20 November although it continued to produce a healthy barrage of C-class and occassional M-class flares. The largest flare from this region was a class M3.5/1N at 09:54 UT on 19 November. This region was believed responsible for producing a Type II sweep between 13:46 UT and 13:49 UT on 18 November. The estimated shock velocity was 1,000 km/sec. No terrestrial impacts occurred from this event.

Region 6368 has continued a very gradual decay since 20 November, maintaining a complex delta configuration in the trailing spot group. It has also continued frequent subflaring with modest amounts of C-class flaring. M-class flares have dropped in frequency since 20 November.

Region 6377 (S04W01) has developed rapidly over the past 24 hours and managed to produce a healthy class M3.1/1B Tenflare at 14:25 UT on 24 November. Other minor discrete radio emissions were observed from this flare. The location of this flare was at S04E04. It lasted 57 minutes, ending at 15:09 UT on 24 November. Region 6368 also managed to produce a class M1.2/SF flare at 23:46 UT on 24 November. Both of these flares produced a SID/SWF.

Geomagnetic activity was unexpectedly low this week. Activity was predicted to be unsettled to active, but maintained almost exclusively quiet conditions throughout the week. Effects from a coronal hole never materialized. As well, predicted solar activity never reached anticipated levels and thus did not produce expected terrestrial impacts.

Auroral activity likewise did not reach anticipated levels. Auroral activity was not visible at middle and low latitudes. Some higher latitudes spotted moderate auroral activity on 18 November, but activity dwindled as the week progressed.

Radio propagation conditions were normal to above normal this week. Relatively strong and stable signals occurred throughout the week at low and middle latitudes due to the unexpectedly quiet geomagnetic and auroral activity. Some increased levels of noise were evident on 18 November due to subsiding geomagnetic activity over higher latitudes. There were numerous short wave fades (SWFs) throughout the week, all attributed to the M-class flare activity from Region 6368. None of the SWF's were intense.
The majority of frequencies affected were below 10 MHz. It is not known whether the SWF's were accompanied by VHF enhancements. Ionization levels were likely not high enough to produce any significant VHF signal enhancements, although there were probably localized area's of enhanced sporadic E during these periods.

As of 25 November, two additional SID/SWF's were observed. The first began at 14:12 UT and ended at 15:05 UT on 24 November. The second began at 23:30 UT and ended at 00:31 UT on 25 November. Both of these events were of low to moderate intensity and were flare-related.

SHORT TERM SOLAR TERRESTRIAL FORECAST

Solar activity is expected to remain mostly low with the possibility for occassional M-class flaring from departing Region 6368 and Region 6377. The Space Environment Services Center is continuing a condition YELLOW alert status for potential PCA and proton events. Region 6368 continues to sport a Beta-Gamma-Delta magnetic configuration with particular delta complexity in the trailer spot group. Probability for a major class X flare is stationary at 10% over the next two days, dropping to 5% on 27 November with the passage of Region 6368 beyond the west limb. There is a 5% probability of a major proton flare from this region. Although these probabilities are low, they warrant attention. The solar flux is expected to drop quite dramatically with the passage of Region 6368 beyond the west limb on 26 and 27 November.

Geomagnetic activity is expected to remain mostly quiet until 26 November when models suggest activity should increase to unsettled levels over all latitudes with a risk of active periods over middle and high latitude regions. No significant activity or storming is expected, however. Conditions should return to quiet to unsettled levels by 28 November.

Auroral activity will be dormant until near 26 November when some increase in activity may occur. Activity will remain confined to the high latitude regions where it is expected to be mostly of low intensity with possible bursts of moderate activity. Auroral activity is then expected to decline to non-visible levels on 27/28 November and remain quiet throughout the remainder of the week.

HF radio propagation conditions should be quite good this week, with only a slight increase in noise and flutter expected near 26/27 November. The expected increase in geomagnetic and auroral activity should not have much of an impact on HF radio communications. So with the exception of 26 and 27 November, HF communications should be above normal on most of the other days this week. Sporadic degraded HF propagation is possible on the sunlit side of the earth due to expected persisting SIDs/SWFs caused by minor solar flaring.

VHF radio propagation should remain normal this week. There is the potential for sporadic DX contacts during SID periods which are expected to occur on the sunlit hemisphere of the earth this week due to minor flaring from departing Region 6368 and Region 6377. Other than these slight possibilities, conditions will not be sufficient to provide widespread DX opportunities this week.

SUMMARY OF ALL ACTIVE REGIONS VISIBLE ON THE SOLAR DISK AS OF 25 NOVEMBER

Region #	Location	LO	Area	Class	LL	Spots	Magnetic Type
6368	N18W65	025	5460	FKI	23	045	BETA-GAMMA-DELTA
6372	S18W27	347	0120	HAX	02	002	ALPHA

NOTES:
This graph ONLY depicts geomagnetic conditions observed at Boulder, Colorado for the past 87 hours. Conditions to the north of Boulder will

generally have slightly higher activity than Boulder, while conditions to the south of Boulder will likely have lower activity than those depicted here. However, the plots should present a good approximate average of planetary geomagnetic conditions.

For information regarding the interpretation and/or use of these charts, send a request for the document "Understanding Solar Terrestrial Reports" to: std_oler@hg.uleth.ca

NOTES:

Predicted geomagnetic activity is based heavily on recurrent phenomena. Transient energetic solar events cannot be predicted reliably over periods in excess of several days. Hence, there may be some deviations from the predictions due to the unpredictable transient solar component.

               Cumulative 60 day Solar Activity Record
                   Start Date:  September 27, 1990
```

NOTES:

Left-hand column digits represent the 10.7 cm solar radio flux obtained from Ottawa. The right-hand column describes the relative solar activity for that period based on the average number of major and minor flares that can be expected for related solar flux values. Plot lines labeled with the letter "F" represent days where at least one major flare occurred (ie. class M5 or greater flare).

Subject: FOR SALE: Shure 444D and Hustler 4-BTV
To: INFO-HAMS@UCSD.EDU

I've got the following items for sale:

*** Shure Microphone model 444D; purchased 2/14/90; $45.00

*** Hustler 4-BTV Multiband Vertical; purchased 8/22/90; $70.00

Both are complete with boxes, manuals, receipts. The 4-BTV was installed on a tower for 3 weeks, and is in excellent shape. The Shure has barely been used.

BTW, the reason for the sale is that it appears I will be spending a good deal of time away from home over the next 2 years. Anybody know of a *hot* 10 meter mag-mount antenna? Doesn't Wilson make something that works well?

Thanks for reading!

In response to an article by Bob Hlivak:

Gordon West is a respected individual who happens to make a living preparing people to take amateur radio exams. His course material is available in radio stores (including Radio Shack) and through mail order.

He's done a lot to get more hams into the ranks. I owe my license to his study materials. What he's doing is both legal and ethical. I fail to understand the nature of your outrage.

73, de KA1TOX

SB RTTYDX @ RTTYDX $RTDX1123
RTTY DX Notes 1of3 11/23/90

RTTY DX Notes for week ending 23rd November 1990
BID: $RTDX1123
Part 1 of 3.

One wonders where the art of communications has gone to? Over the past week I have been looking at the mini mailboxes. I Saw 43 of them. Are they all small sized PK232s? It seems that with the proliferation of these units it will soon be impossible to find a space to have a QSO. I think that an original idea that was put forward would be a viable answer. All mailboxes (including mini mailboxes) be shifted to 10 and 18 MHz. That would be a logical answer. Use those frequencies, or lose them.

Our thanks this week go to DJ3IW and the Saar-Pfalz-DX-Club Packet Cluster, I5FLN, I5ICY, I5IGQ, JA1BLV, N2HOS, OD5NG, TG9VT, VK2EG, W2JGR and the Tri-State DX Packet Cluster Network. Thank you all for your very welcome information and help.

RTTY DX Notes 3of3 11/23/90

RTTY DX Notes for week ending 23rd November 1990
BID: $RTDX1123B
Part 3 of 3.

QSL Information:

UC2OCJ says to QSL via Box 68, Gomel. 246027 Buelrussia, USSR.

9X5LJ and 9X5AB request their cards be sent to Box 81, Kigali, Rwanda.

UH8EA collects his cards from W5BWA.

5N0ETP collects his cards via N6LQL.

9Q5TE has SM0BFJ as his QSL manager.

CE0ZZZ says to QSL to Box 13312 Santiago, Chile.

Notes of Interest:

JA3DLE/1 reports that JG1RVN will be QRV from XU for 6 days from 3rd to 9th December with lots of RTTY.

On 27th November, or around that date, (after the CW contest), N7NG, OH2BH, OH2RF, and ZS6BCR will operate from Penguin Island (off the coast of Namibia) for 6 days by special permission of the South African Nature and Conservation people. The callsign could be ZS9Z/ZS1, after which they will operate from Walvis Bay with the callsign of ZS9Z for 4 days. They will use Icom gear and the QSLS go to OH2BH.

3W3RR is still hopeful of operating from Spratley in December.

Kure Island (KH7) is scheduled for December 12-21, all bands including 6 meters, if they can find some gear and aerials for 6. If you can help, call 671-346-2201 (in Guam) after 0600Z. Prefixes may be KH7/AH7/WH7 for the prefix hunters. The basic callsign will be KD7P/NH7.

SP5FYM is headed for King George Island (Antarctica) for January 1991.

There is a plan to activate 'MV' Island (in the Gulf of Finland) in March 1991. They require RTTY gear. More later.

GL DE DX1 (VK2SG).

Please Note:

A few modifications have been made to these reports. In addition to the new 20-day solar flux forecasts, new prediction charts have been added for potential VHF DX propagation. Included with the VHF DX propagation prediction charts are SID and auroral backscatter enhancement predictions charts. Comments regarding the inclusion/removal of these new features are welcomed. In order to keep the size of these reports down, some of the extraneous information has been removed.

An informational document is being prepared to aid those who are interested in understanding and using these reports in practical applications. To obtain this file, request the document "Understanding Solar Terrestrial Reports" from: "std_oler@hg.uleth.ca".

--- SOLAR TERRESTRIAL FORECAST AND REVIEW ---
November 24 to December 04, 1990

Report Based In-Part from Data Obtained from the
Space Environment Services Center
Boulder Colorado

=====---

SOLAR TERRESTRIAL REVIEW FOR 18 NOVEMBER TO 24 NOVEMBER.

Solar activity over the last week was mostly moderate. Numerous M-class flare's occurred throughout the week. Almost all of the activity was attributed to Region 6368, which dominated the disk with its large size and magnetic complexity.

Region 6368 attained a maximum size of 9,240 million square kilometers (3,610 million square miles) on 18 November, encompassing a total of 107 spots. It is a magnetically complex Beta-Gamma-Delta region. The trailer spot complex was most active and has consistently held a delta-configuration. This region was uncharacteristically inactive considering the size and magnetic complexity that it attained. No major flares occurred from this region, although warnings were issued earlier in the week regarding the potential developement of major flare activity.

Region 6368 showed signs of decay on 20 November although it continued to produce a healthy barrage of C-class and occassional M-class flares. The largest flare from this region was a class M3.5/1N at 09:54 UT on 19 November. This region was believed responsible for producing a Type II sweep between 13:46 UT and 13:49 UT on 18 November. The estimated shock velocity was 1,000 km/sec. No terrestrial impacts occurred from this event.

Region 6368 has continued a very gradual decay since 20 November, maintaining a complex delta configuration in the trailing spot group. It has also continued frequent subflaring with modest amounts of C-class flaring. M-class flares have dropped in frequency since 20 November.

Region 6377 (S04W01) has developed rapidly over the past 24 hours and managed to produce a healthy class M3.1/1B Tenflare at 14:25 UT on 24 November. Other minor discrete radio emissions were observed from this flare. The location of this flare was at S04E04. It lasted 57 minutes, ending at 15:09 UT on 24 November. Region 6368 also managed to produce a class M1.2/SF flare at 23:46 UT on 24 November. Both of these flares produced a SID/SWF.

Geomagnetic activity was unexpectedly low this week. Activity was predicted to be unsettled to active, but maintained almost exclusively quiet conditions throughout the week. Effects from a coronal hole never materialized. As well, predicted solar activity never reached anticipated levels and thus did not produce expected terrestrial impacts.

Auroral activity likewise did not reach anticipated levels. Auroral activity was not visible at middle and low latitudes. Some higher latitudes spotted moderate auroral activity on 18 November, but activity dwindled as the week progressed.

Radio propagation conditions were normal to above normal this week. Relatively strong and stable signals occurred throughout the week at low and middle latitudes due to the unexpectedly quiet geomagnetic and auroral activity. Some increased levels of noise were evident on 18 November due to subsiding geomagnetic activity over higher latitudes. There were numerous short wave fades (SWFs) throughout the week, all attributed to the M-class flare activity from Region 6368. None of the SWF's were intense. The majority of frequencies affected were below 10 MHz. It is not known whether the SWF's were accompanied by VHF enhancements. Ionization levels were likely not high enough to produce any significant VHF signal enhancements, although there were probably localized area's of enhanced sporadic E during these periods.

As of 25 November, two additional SID/SWF's were observed. The first began at 14:12 UT and ended at 15:05 UT on 24 November. The second began at 23:30 UT and ended at 00:31 UT on 25 November. Both of these events were of low to moderate intensity and were flare-related.

SHORT TERM SOLAR TERRESTRIAL FORECAST

Solar activity is expected to remain mostly low with the possibility for occassional M-class flaring from departing Region 6368 and Region 6377. The Space Environment Services Center is continuing a condition YELLOW alert status for potential PCA and proton events. Region 6368 continues to sport a Beta-Gamma-Delta magnetic configuration with particular delta complexity in the trailer spot group. Probability for a major class X flare is stationary at 10% over the next two days, dropping to 5% on 27 November with the passage of Region 6368 beyond the west limb. There is a 5% probability of a major proton flare from this region. Although these probabilities are low, they warrant attention. The solar flux is expected to drop quite dramatically with the passage of Region 6368 beyond the west limb on 26 and 27 November.

Geomagnetic activity is expected to remain mostly quiet until 26 November when models suggest activity should increase to unsettled levels over all latitudes with a risk of active periods over middle and high latitude regions. No significant activity or storming is expected, however. Conditions should return to quiet to unsettled levels by 28 November.

Auroral activity will be dormant until near 26 November when some increase in activity may occur. Activity will remain confined to the high latitude regions where it is expected to be mostly of low intensity with possible bursts of moderate activity. Auroral activity is then expected to decline to non-visible levels on 27/28 November and remain quiet throughout the remainder of the week.

HF radio propagation conditions should be quite good this week, with only a slight increase in noise and flutter expected near 26/27 November. The expected increase in geomagnetic and auroral activity should not have much of an impact on HF radio communications. So with the exception of 26 and 27 November, HF communications should be above normal on most of the other days this week. Sporadic degraded HF propagation is possible on the sunlit side of the earth due to expected persisting SIDs/SWFs caused by minor solar flaring.

VHF radio propagation should remain normal this week. There is the potential for sporadic DX contacts during SID periods which are expected to occur on the sunlit hemisphere of the earth this week due to minor flaring from departing Region 6368 and Region 6377. Other than these slight possibilities, conditions will not be sufficient to provide widespread DX opportunities this week.

SUMMARY OF ALL ACTIVE REGIONS VISIBLE ON THE SOLAR DISK AS OF 25 NOVEMBER

Region #	Location	LO	Area	Class	LL	Spots	Magnetic Type
6368	N18W65	025	5460	FKI	23	045	BETA-GAMMA-DELTA

NOTES:

This graph ONLY depicts geomagnetic conditions observed at Boulder, Colorado for the past 87 hours. Conditions to the north of Boulder will generally have slightly higher activity than Boulder, while conditions to the south of Boulder will likely have lower activity than those depicted here. However, the plots should present a good approximate average of planetary geomagnetic conditions.

For information regarding the interpretation and/or use of these charts, send a request for the document "Understanding Solar Terrestrial Reports" to: std_oler@hg.uleth.ca

NOTES:

Predicted geomagnetic activity is based heavily on recurrent phenomena. Transient energetic solar events cannot be predicted reliably over periods in excess of several days. Hence, there may be some deviations from the predictions due to the unpredictable transient solar component.

    ============================================================
               Cumulative 60 day Solar Activity Record
                   Start Date:  September 27, 1990
```

NOTES:

Left-hand column digits represent the 10.7 cm solar radio flux obtained from Ottawa. The right-hand column describes the relative solar activity for that period based on the average number of major and minor flares that can be expected for related solar flux values. Plot lines labeled with the letter "F" represent days where at least one major flare occurred (ie. class M5 or greater flare).

GRAPHICAL 20-DAY SOLAR ACTIVITY PREDICTION

NOTES:

These VHF DX prediction charts are defined for the 50 MHz to 220 MHz bands. They are based primarily on phenomena which can affect VHF DX propagation globally. They should be used only as a guide to potential DX conditions on VHF bands. Latitudinal boundaries are the same as those for the HF predictions charts. For more information, request the document "Understanding Solar Terrestrial Reports" from: "std_oler@hg.uleth.ca".

Subject: STATES WHERE RADAR DETECTORS ARE ILLEGAL?
To: info-hams@ucsd.edu

In response to an article by Eakin:

>> radar detectors are illegal in Virginia, a friend says
its Maryland. <<

Connecticut and Virginia for sure....maybe other states too.

I read in the latest Sweden Calling Dxers that
Sweden was thinking about using a part of the fm band for digital audio
broadcasting. I am interested in knowing information regarding
this mode. Any technical information would be appreciated.
I know that the Ebu. is looking into such a system and it is being looked
at here in the Usa. as well. Any info would be appreciated.

Hello Folks!

I recently purchased a Uniden HR2600 and a Microwave Modules MMT 144/28
2-meter linear transverter and got both interfaced and working well.
The HR2600 has an output power of 25 watts PEP on SSB, CW and 10 watts on
AM and FM. The transverter requires only 0.25 to 25 mW of 28 MHz drive for
proper operation. In an effort to reduce the HR2600 output level to the
level required by the transverter, I removed PB-100, a small double-sided
copper coated circuit board located under the top cover that supplies +Vcc
to the driver and final amplifier stages. I then soldered a jumper between
TP2 and TP4, the outermost prongs that hold PB-100 in place.

This action provides the HR2600 driver with full +Vcc, but removes +Vcc
from the MRF 477 final power amplifier. There is more than enough driver
energy fed through the final to excite the transverter in this configuration.

I've received good signal and audio reports from all the locals when using the transverter and the HR2600 with this simple modification. I believe this modification could make the HR2600 useable with other transverters as well.

73 and Good DX! de John, KD2BD

Summary: Review of technical aspects of _Memphis Belle_
Keywords: B-17,Memphis,Belle,SPOILER

WARNING: The following post is a SPOILER, so if you haven't seen the movie and want to see it fresh, abort this post now....

LAST WARNING......

TOO LATE!

"Command Set" junkies will like the racks of 'em mounted on the B-17's in Memphis Belle. Also prominent were B-voltage batteries, J-73 straight keys, etc. Somewhat amusing was the conversation between the radio operators of 2 bombers on the way to the target in Germany. The rookie operator was unsure of what to log and radioed the experienced one for help. "Just log everything, when you get more practice you'll know what to leave out." is a rough paraphrase of the answer. I'm sure there are those of us who could benefit from such advice. :-)

I have a hunch that if that conversation actually took place, it was in telegraphy (if I say the 2-letter abbreviation, it won't make it through the kill files of SOME users). The use of phone was probably for the movie audience's benefit. Any older radio op's wanna confirm/deny this?

When the German fighter sliced through the tail section of the rookie plane and their screams go out over the air to be picked up by the entire group, their signal fades into something that sounds like a dead ringer for HF weather fax. Seems the sound crew used the wrong FX for static! This is the ONLY slip-up, though.

It's refreshing to see a film that is technically accurate and believable, particularly since this one didn't break the bank like MIDWAY, which ventured to be accurate in EVERYTHING (including the >A1A<, I'm running out of synonyms! :-). I suspect the Confederate Air Force provided the planes, communications gear and all. Anyone in the CAF want to comment on the radio part of these plane's restoration and maintenance? Were those modern antennas/sensors that I saw on some of the planes in the movie to meet contemporary FAA regulations? Just curious.....

Hello,

I am asking for a friend...

He wants to put up an outdoor dipole antenna, and needs to tune it for 27.205 MHz. He needs the formula for wire length and type (gauge) for such an antenna. Thanks a lot. Please respond to me via email, the Internet address is below, since I don't read this group.

I've got the following items for sale:

*** Shure Microphone model 444D; purchased 2/14/90; $45.00

*** Hustler 4-BTV Multiband Vertical; purchased 8/22/90; $70.00

Both are complete with boxes, manuals, receipts. The 4-BTV was installed on a tower for 3 weeks, and is in excellent shape. The Shure has barely been used.

BTW, the reason for the sale is that it appears I will be spending a good deal of time away from home over the next 2 years. Anybody know of a *hot* 10 meter mag-mount antenna? Doesn't Wilson make something that works well?

Thanks for reading!

pbhx@ellis.uchicago.edu (Peter B. Hayward) writes:
>I have the instructions for the mod to allow out of band
>transmit for the 32AT, but I wondered if there was anyone here
>who had done it. I would like to learn of your experience before
>I go ahead.

I have done it. I found that the suggested points to wire in the two diodes were awfully small and close to some surface mount parts compared to a couple other points a few mm's toward the top of the radio that I discovered by tracing the foil lines. I double checked to make sure that they were correct by:

1. Comparing the lines on the actual board to the lines on the board diagram in the service manual.

2. Following the lines to other components and comparing that to the schematic.

I then wired the two diodes from a common point I also traced to on the lower right, which was big enough for the twisted common end of the two diodes. The other ends went to the two other points I first mentioned.

These two diodes enable out of band transmit for each band separately, though I never determined which was which. If you do not want the out of band transmit, don't bother with these diodes.

I used the "switching diodes" Radio Shack sells.

I put insulation on the diode leads by stripping some off some large gauge wire first. Ordinary loose insulation is too big. This allowed me to keep everything as flat as possible.

The other mods call for cutting diodes in the lower right of the board, and I cut only ONE END of each, and put some insulation over the cut end with excess hanging on to prevent recontact.

I chose NOT to make the cut to enable 10 MHz frequency entry (personal preference).

>(Yes, yes, I know this is all wrong, type-accepted radios, etc.,
>but I want to have a backup to my marine radio in case it goes
>out just when I need it -- as it did once.)

It's too bad that when some people know that certain things are wrong, they go off and start telling you that OTHER things are wrong as well. Some people cannot even tell the difference sometimes. It depends on the question asked. I have never seen a law (and I looked for it) that makes it illegal to make these mods or to have such a modified radio.

There are some laws that make its use for many things illegal, but some people take that as liberty to claim other things to be illegal as well. Double check any such posting to see if the answer is one for the question you are asking, or if they are just answering the question they wished was asked.

Please Note:

A few modifications have been made to these reports. In addition to the new 20-day solar flux forecasts, new prediction charts have been added for potential VHF DX propagation. Included with the VHF DX propagation prediction charts are SID and auroral backscatter enhancement predictions charts. Comments regarding the inclusion/removal of these new features are welcomed. In order to keep the size of these reports down, some of the extraneous information has been removed.

An informational document is being prepared to aid those who are interested in understanding and using these reports in practical applications. To obtain this file, request the document "Understanding Solar Terrestrial Reports" from: "std_oler@hg.uleth.ca".

--- SOLAR TERRESTRIAL FORECAST AND REVIEW ---
November 24 to December 04, 1990

Report Based In-Part from Data Obtained from the
Space Environment Services Center
Boulder Colorado

SOLAR TERRESTRIAL REVIEW FOR 18 NOVEMBER TO 24 NOVEMBER.

Solar activity over the last week was mostly moderate. Numerous M-class flare's occurred throughout the week. Almost all of the activity was attributed to Region 6368, which dominated the disk with its large size and magnetic complexity.

Region 6368 attained a maximum size of 9,240 million square kilometers (3,610 million square miles) on 18 November, encompassing a total of 107 spots. It is a magnetically complex Beta-Gamma-Delta region. The trailer spot complex was most active and has consistently held a delta-configuration. This region was uncharacteristically inactive considering the size and magnetic complexity that it attained. No major flares occurred from this region, although warnings were issued earlier in the week regarding the potential developement of major flare activity.

Region 6368 showed signs of decay on 20 November although it continued to produce a healthy barrage of C-class and occassional M-class flares. The largest flare from this region was a class M3.5/1N at 09:54 UT on 19 November. This region was believed responsible for producing a Type II sweep between 13:46 UT and 13:49 UT on 18 November. The estimated shock velocity was 1,000 km/sec. No terrestrial impacts occurred from this event.

Region 6368 has continued a very gradual decay since 20 November, maintaining a complex delta configuration in the trailing spot group. It has also continued frequent subflaring with modest amounts of C-class flaring. M-class flares have dropped in frequency since 20 November.

Region 6377 (S04W01) has developed rapidly over the past 24 hours and managed to produce a healthy class M3.1/1B Tenflare at 14:25 UT on 24 November. Other minor discrete radio emissions were observed from this flare. The location of this flare was at S04E04. It lasted 57 minutes, ending at 15:09 UT on 24 November. Region 6368 also managed to produce a class M1.2/SF flare at 23:46 UT on 24 November. Both of these flares produced a SID/SWF.

Geomagnetic activity was unexpectedly low this week. Activity was predicted to be unsettled to active, but maintained almost exclusively quiet conditions throughout the week. Effects from a coronal hole never materialized. As well, predicted solar activity never reached anticipated levels and thus did not produce expected terrestrial impacts.

Auroral activity likewise did not reach anticipated levels. Auroral activity was not visible at middle and low latitudes. Some higher latitudes spotted moderate auroral activity on 18 November, but activity dwindled as the week progressed.

Radio propagation conditions were normal to above normal this week. Relatively strong and stable signals occurred throughout the week at low and middle latitudes due to the unexpectedly quiet geomagnetic and auroral activity. Some increased levels of noise were evident on 18 November due to subsiding geomagnetic activity over higher latitudes. There were numerous short wave fades (SWFs) throughout the week, all attributed to the M-class flare activity from Region 6368. None of the SWF's were intense. The majority of frequencies affected were below 10 MHz. It is not known whether the SWF's were accompanied by VHF enhancements. Ionization levels were likely not high enough to produce any significant VHF signal enhancements, although there were probably localized area's of enhanced sporadic E during these periods.

As of 25 November, two additional SID/SWF's were observed. The first began at 14:12 UT and ended at 15:05 UT on 24 November. The second began at 23:30 UT and ended at 00:31 UT on 25 November. Both of these events were of low to moderate intensity and were flare-related.

SHORT TERM SOLAR TERRESTRIAL FORECAST

Solar activity is expected to remain mostly low with the possibility for occassional M-class flaring from departing Region 6368 and Region 6377. The Space Environment Services Center is continuing a condition YELLOW alert status for potential PCA and proton events. Region 6368 continues to sport a Beta-Gamma-Delta magnetic configuration with particular delta complexity in the trailer spot group. Probability for a major class X flare is stationary at 10% over the next two days, dropping to 5% on 27 November with the passage of Region 6368 beyond the west limb. There is a 5% probability of a major proton flare from this region. Although these probabilities are low, they warrant attention. The solar flux is expected to drop quite dramatically with the passage of Region 6368 beyond the west limb on 26 and 27 November.

Geomagnetic activity is expected to remain mostly quiet until 26 November when models suggest activity should increase to unsettled levels over all latitudes with a risk of active periods over middle and high latitude regions. No significant activity or storming is expected, however. Conditions should return to quiet to unsettled levels by 28 November.

Auroral activity will be dormant until near 26 November when some increase in activity may occur. Activity will remain confined to the high latitude regions where it is expected to be mostly of low intensity with possible bursts of moderate activity. Auroral activity is then expected to decline to non-visible levels on 27/28 November and remain quiet throughout the remainder of the week.

HF radio propagation conditions should be quite good this week, with only a slight increase in noise and flutter expected near 26/27 November. The expected increase in geomagnetic and auroral activity should not have much of an impact on HF radio communications. So with the exception of 26 and 27 November, HF communications should be above normal on most of the other days this week. Sporadic degraded HF propagation is possible on the sunlit side of the earth due to expected persisting SIDs/SWFs caused by minor solar flaring.

VHF radio propagation should remain normal this week. There is the potential for sporadic DX contacts during SID periods which are expected to occur on the sunlit hemisphere of the earth this week due to minor flaring from departing Region 6368 and Region 6377. Other than these slight possibilities, conditions will not be sufficient to provide widespread DX opportunities this week.

SUMMARY OF ALL ACTIVE REGIONS VISIBLE ON THE SOLAR DISK AS OF 25 NOVEMBER

Region #	Location	LO	Area	Class	LL	Spots	Magnetic Type
6368	N18W65	025	5460	FKI	23	045	BETA-GAMMA-DELTA

NOTES:

Predicted geomagnetic activity is based heavily on recurrent phenomena. Transient energetic solar events cannot be predicted reliably over periods in excess of several days. Hence, there may be some deviations from the predictions due to the unpredictable transient solar component.

    ------------------------------------------------------------
               Cumulative 60 day Solar Activity Record
                   Start Date:  September 27, 1990
```

NOTES:

Left-hand column digits represent the 10.7 cm solar radio flux obtained from Ottawa. The right-hand column describes the relative solar activity for that period based on the average number of major and minor flares that can be expected for related solar flux values. Plot lines labeled with the letter "F" represent days where at least one major flare occurred (ie. class M5 or greater flare).

NOTES:

These VHF DX prediction charts are defined for the 50 MHz to 220 MHz bands. They are based primarily on phenomena which can affect VHF DX propagation globally. They should be used only as a guide to potential DX conditions on VHF bands. Latitudinal boundaries are the same as those for the HF predictions charts. For more information, request the document "Understanding Solar Terrestrial Reports" from: "std_oler@hg.uleth.ca".

>Come on people, variety is the spice of life as they say, if you don't
>like a certain topic theres always the 'n' key, rn macros, kill files

Can we get off this 'n' key crap? Some people don't like to have to keep pressing this key time and time again. It is too easy to just SAY that there is such a key, but when you add up the time it takes to display the next posting, and the number of postings someone does not want to read, day after day, this really starts to add up in terms of time spent reading, or specifically NOT reading.

Not everyone is skilled at writing macros. If you want to offer a service to these people to do so, then please post your offer and then more people can take advantage of the feature. The same goes for kill files.

>etc. etc. I for one don't believe there is any need to further fragment
>this news group. Of course I like hot and spicy Mexican food also and
>I realize there are lots of people who don't get much past milk and
>cookies :-)

Some people even get beyond that: Chinese, Indian, Thai, Indonesion, and many more.

Hi, Guys!

The good news is that the ham stacks are now available on apple.com via ftp. The bad news is that I've gotten two requests why they can't be unpacked using StuffIt. Hopefully to reduce the amount of email, I'll make this an article instead.

The reason why these ham stacks can't be unpacked with StuffIt is because
they were never PACKED by StuffIt. StuffIt doesn't do a good enough job
to allow all five Ham Stacks on a single 800K diskette. I used a compressor
called Diamond4.2, which is included on all diskettes that I send out
(including the one I sent to the people at apple.com). Hopefully, they
either unpacked them before putting them on the computer, or they included
the Diamond4.2 compactor on the computer as well. Go back and check for
the Diamond4.2 compactor program.

Hope this helps.

Diana

In a recent digest, Mark Eakin asked:

| As long as this is still the place for legal RF questions, I've have one:
|
| I seem to remember that radar detectors are illegal in Virginia, a friend says
| its Maryland. Does anyone know? I hope we're not both right, I'm moving up
| there soon.
| --
I can't say about Maryland, but in Virginia it is *ILLEGAL* to operate a
radar detector in your vehicle. If you're stopped by an officer/trooper/deputy
and you have one hooked up *OR* if the unit is accessible to the driver from
inside the vehicle (like laying on your seat, even if it's disconnected) then
you're fair game for a ticket. If it's locked up in your trunk where you can't
get at it while driving then you're safe.

Years ago they would actually confiscate the device; I don't think that's done
now.

Very interesting: then what was that bright orange spot I've seen recently from Germany? If NASA wants to go to Mars, and if it wants to go alone, it's o.k. - but do they then have to restrict its visibility :-) ?

Except for Antarctica, of course, Mars is visible these days at 8 p.m. local time around the globe.

Hi again. I finally received my Novice call in the mail a few weeks ago! KA1WNU/KT. I was able to upgrade from Novice to Technician in just 3 days with the help of Gordon West's Technician guide from Radio Shack. His material was excellent. My question is: Does anyone know if Gordon West has any study guides for license classes higher than General? I am presently studying his General class book, and would be very disapointed if this was his highest level book.

Any help out there?

A good friend of mine moved down to Florida a few weeks ago from here in Boston, Mass. He is not a Ham, but he said his father is, but also said that he didn't believe his father was active in the hobby. Does anyone know? My friend's father's name is Daniel A. Kane, WA2FEG. Mr. Kane presently resides in Ft. Lauderdale, Florida. Has anyone heard WA2FEG on any of the bands?

THX for any help.

We have set up a directory on one of our machines for anonymous FTP'ing of T.S. Kelso's NASA element sets. Dr. Kelso is mailing them directly to me as well as posting them to various newsgroups. I will make them immediately available for anonymous FTP once I receive them. The current and the previous versions will be available.

The element sets are available from:

nachos.ssesco.com [192.55.187.18]

in the directory:

nasa_elements

The filenames are of the form:

nasaXXX

where 'XXX' is the element set number as released by Dr. Kelso.

Problems with FTPing? Address them to: elmquist@ssesco.com

Does anyone know who I should contact regarding the possible purchase of some of Boston University's Amateur Radio Club equipment? I have heard that their club has gone under, and that they are (were) looking for buyers of their equipment. If anyone knows anything about this (or if my information is completely wrong), please e-mail me.

Thanks much,

hi,

I am back with the results from my battle with alinco. For those who have seen this before and are familiar with my quest the new info is on the last page of this posting. For those who are not familiar read on. For those who don't care oh well . . . .

Mail id: 2493
From: szarekw (William J. Szarek)
To: info-hams@ucsd.edu
Date: Thu, 11 Oct 90 10:07:26 EDT

Subject: re:Alinco DR-590T

In response to buzz here are my findings regarding the 590T

>I just picked up a brand new Alinco DR-590T and have had some problems that
>I would like to share with you all out there in ham-net land. Maybe someone
>out there can help me with a couple of these problems.

I guess not too many people have these rigs yet otherwise I would not have to respond to your request. I hope there are others besides yourself that are interested in this information. In any event this is what worked for me (sans jinglish). I am not however responsible for what you do to your rig . . . etc.

>1, I got this unit because of all the cool features it is supposed to have,
>including cross-band repeat. The instruction manual does not even mention
>this feature. After calling Alinco I found that this was a feature functions
>only after modification. They said (more than a week and a half ago) that they
>would send me the modification instructions. I haven't heard anything from
>them.

If you ask them (nicely) there are (a few) dudes at Alinco that are willing to help and are smart enought to be helpfull (there is a differance ;-}). They can fax you the information or even send it to you next day air at no charge if you ask politely or are VERY persistant (as in my case).
Now the big news . . . to modify the rig to xmit out of band (to call the cops etc ;-}), to operate as a cross band remote, etc. follow these easy steps.
1) remove the control head from the unit (2 screws on each side of the forward part of the rig, near the control head).

2) hold the control head in your hand face down and remove the two screws you see on the back of the control head.

3) remove the cover from the back of the control head (it snaps off)

4) locate a blue loop of wire. There is only one blue loop of wire.

5) cut, unsolder, remove, destroy, nuke, the blue wire (your choice) [I neither advocate nor encourage the indiscriminate use of nukes]

6) undo step 3

7) undo step 2

8) undo step 1

9) connect the rig to antennas, power etc as outlined in the manual.

10) hold down the function key and turn on the power

This is what you will find . . .
The rig now transmits everywhere.
it now will display (not receive) 800Mhz band and 300Mhz band on the 440 side of the display in rotation (press the uhf switch to switch from band to band)
It will now display (not recieve) the aircraft band (yes it does indicate AM) on the 2 meter side of the rig. There is no AM detector presently but I am working on it.

Cross band operation:
To enable cross band remote press (and hold) the funciton key and then (while still holding the function key) press the vhf switch. Cross band operation is now enabled using the displayed TX and RX frequencies. Splits still funciton in cross band operation so don't link 2 repeters together! Frequency selection for each band can be from the vfo, memory, or ARM (a cool Alinco function).
To disable cross band operation simply press (and hold as before) the funciton key and press the uhf switch. Note: failing to hold the f-key down and then pressing uhf or vhf enables a strange function that I have yet to figure out.

>2, The Autodialer (an option for the 590E according to page 13 of the manual)
>did not work as in the insturctions. Another call to Alinco and I found
>that it is also an option in the 590T. On page 19 it was pointed out to
>me is a note to this effect. These instructions are also unclear. Anyway
>I went out and purchased the required DTMF unit and installed it. Now I
>can store the numbers in the autodialer's memories, however I cannot get
>the rig to autodial any number except the number stored in memory #1. I
>have tried every possible interpretation of the directions on page 13 of
>the manual and had no success. Another call to Alinco . . . they told me
>that they knew that the manual was written in jinglish (japanese/english)
>and was hard to understand. They said that they would send me a complete
>manual written by someone who spoke english as their primary language. I
>asked them why this manual was not provided with the rig and they said that
>it was free to anyone who asked for it ?!?!

Simple problem . . . a typeing error (translation error?).
Turn to page 13 of the instructions
find "Transmitting the Stored Autodialer Number:(DR-590E: Option)

Step 2 should read:
Enter DTMF pad code c14 and select the desired autodialer channel.

>3, This rig is supposedly able to receive DTMF codes from another transmitter
>What will allow remote control of the rig (useful as a very flexible cross
>band repeater). I have not been able to get this to function on my rig at
>all. I can only hope that possibly the modification they promised to send
>me will enable this function or that the new english directions will beable
>to explain how to make this happen.

Even the grand Alinco wizzard has not figured this out. He said that he was working on better directions and that as soon as he had them he would send them to me.

>4, The remote page/DTMF squelch function are completely cryptic I hope they
>are also explained in the english directions.

Same deal as above. However if you sat around with a friend who also had
a similarly equipped rig you could probabily figure it out.

>Anyone with any mods or operation instructions for this rig please let me
>know. Am I the only one with these problems? Does anyone have any solutions?
>Is Alinco always this slow? etc.?

Here are your mods/instructions. Yes I believe you are. I found the solutions.
In my experience Alinco has always operated in this manner.

>I will post a summary when a solution is found
>so send responses to me at my address:szarekw@lonex.radc.af.mil

Here is the summary. In case you haven't figgured it out by now I am answering
my own query. I just figgured someone might want the info.

Subject: DR590T Remote Control
X-Acknowledge:

And now the long awaited jinglish - english translation for the remote control
of the DR-590t by a transceiver with DTMF. (and as a bonus a big disappointment)

The following is a direct copy of the info Alinco was kind enough to send
me. [my comments appear in these brackets]

1. Set frequency
        a, go to vfo mode and set desired frequency on the DR-590T, and fully
open squelch. ("Busy" indicator will appear).
        b, Set same frequency on the remote Transceiver, and fully open squelch.
           [not necessary]

2. Set Remote Channel and access code.

a. enter C10 on the DR-590 Touch Tone Mic Pad. *the frequency display will flash).

b. Enter channel selection (one numerical digit (1-4) and an access code (three numerical digits) on the DR-590T touch Tone Mic Pad. [it would be good for you to compare this part with the DSQ function descrition in the manual so that you can see "What is realy happening here"]

3. Enter DSQ function in the DR-590T

a. enter C!@ on the DR-590T Touch Tone Mic Pad.
(DSQ indicator will flash)

b. Push the PTT on the DR-590T Mic.
DSQ indicator will stop flashing and the "busy" indicator turns off)

c. Press the "f" (function) key and the MHz (up) key. The DSQ starts flashing again, and there will be a confirmation tone.

4. Access Remote Transceiver to DR590T

a. From the remote transceiver, transmit same DTMF access code (three numerical digits) as set into the DR-590T. The "Busy" indicator turns on the DR-590T (normally, you will hold the PTT on your remote transceiver and push the appropriate DTMF tones). [???? Jinglish again ?!?!?!?]

5. Initiate remote control commands

a. From the remote transceiver, transmit the desired "C" code (see page 14 of the DR-590T manual) from the dtmf Touch Tone Pad.

b. If you want to perform an additional remote commands you must remember to put the remote transciever in the same frequency that the DR-590T may be in. [how in the hell do you know if you are remote from the DR-590 and if you err durring a remote command how do you recover . . . more on this later] Retransmit the access code and the desired "c" code.

6. Cancelling the remote control function and turning off the dsq function

a. If the DSQ indicator is not flashing, enter C12 on the touch tone pad of the dr-590t. the dsq will start flashing.

b. With the dsq indicator flashing, press the MHz (down) button once. The dsq indicator will turn off.

--End of instructions from Alinco --

Now the bummer
This function does not allow you to control frequency selection/etc on the other band. (i.e. from 440 you cannot switch over to 2meters and change frequency and then go back to 440). You cannot operate this function in conjunction with any of the memories, you must remain in VFO mode. This function does not opperate in cross band remote mode.

I am a bit miffed that Alinco didn't see this through. They could have created the all time worlds greatest mobile rig that would allow one to access it via 440 and then work any of your favorite 2 meter repeters operating as a remote base. They even saw fit include a dtmf function that allows you to remote key the transmitter (rather than running as a repeater). This in conjunction with the other functions that are 1/2 implemented certainly say something about Alinco.

Counter point
It is still a great radio and I would buy it again still knowing what I know now. The only differance is that I wouldn't be as disappointed when I found out that the rig doesn't "really" do all that Alinco says it can do.

Any way I hope you enjoy your rig as much as I enjoy mine.

73
buzz
KE2WD

****

Now the good news.

After working with(?) alinco regarding the "features" of this rig I have discovered how to repeter hop using the remote base (cross band feature) of DT-590.

Start with the rig in 'normal' mode. (just like you would use it normally).

On the 2 meter side of the rig select a known repeter on a frequency above 147.000 Mhz including the positive (this is important) offset and put this frequency and offset into the vfo.

Press the function button.

Press the up or down buttons on the microphone untill memory channel A is selected on the display.

Press Memory Write key.

Key the mike (don't forget to I.D.).
If you hear the squelch tail from the repeter you will have stored the repeter frequency in the ARM. (see Alinco instructions for operation of this feature, they are not to bad).

Now enter any repeter frequency below 147.000MHz including the negative offset.

Key the mike (ID) and listen for the squelch tail.

notice the negitive offset.

now enter any repeter frequency and you will notice that the offset will automatically be "-" for repeter frequencies lower than 147.000 and will be "+" for repeter frequencies greater (or equal to) 147.000 in accordance with the commonly accepted bandplan.

This will function in the remote control mode so now you can repeter hop with your remote base unit, controling it with your 440 HT. Nothing like a 45 watt handheld!

Enjoy

Buzz

WM1W

P.S. I haven't called Alinco yet so they still don't know about this feature. Up to now they have told me that this function was imposible and that if I discovered how to do it please call them otherwise please leave them alone (I've been quite a pest). So in the true spirit of ham radio I decided to publish my findings here . . . before I called alinco. That way "we" know where "they" got "their" information from ! |-}

Anyone else out there in Net-o-land have a mobile set-up which rivels
Buzzards? I once saw a picture of a mobile set-up with 2 meter 11 element

beams on it. (I think it was QST).

len,
thanks for the catching this. . .

The mast is 54" not 54'... but now that you mention it what a great Idea!

A quick question to any experts on PArt 97:
A friend and I, recently started into VHF (2M) packet radio, were wondering
if it'd be legal to interface a TNC with a standard telephone modem to
allow us to call landline bulletin board systems while mobile. The interface
would be "one-way" ie - we could call out but noone could call in.
The system would be used only for our enjoyment - nothing involving
buisness.
Please reply to MATTHIAS@PINE.CIRCA.UFL.EDU (internet) or MATTHIAS@UFPINE
(bitnet).
Thanks in advance for helping with this..

As a point of trivia, I've been wondering which single ham repeater has the largest coverage area accessable with ordinary equipment. This question includes all repeaters, but is limited to the area served by a single machine (not the area served by multiple linked machines).

For example, the Mt. Lemmon Repeater, 147.15, is one of the farthest reaching that I can think of. It is located at a level of 9000+ feet and has an extremely high HAAT (Height Above Average Terrain). It can be accessed with a handheld from Phoenix, over 100 miles to the north. This would seem to indicate that it covers an area of nearly 30,000 square miles. Given that much of this is probably shaded, I would guess that 15,000 is not unlikely with this machine. This area does not include the other machines in the ZIA link which are conected to the 715 machine (a good story by itself).

Which other machines around the contry or the world are in this category? Which machine do you think would rank as the worlds largest in terms of coverage area?

Inquiring minds want to know... :-)

Since you ask...
     97.115(b) The third party may participate in stating the
                  message where:
                    (1) The control operator is present at the control
                        point and is continuously monitoring and
                        supervising the third party's participation...

Note the use of the word "continuously."  That means the control op must
review (monitor) *all* of the third-party communications, not just some
portion thereof marked mechanically.

They expect a good-faith effort to follow the rules, not to (mis)interpret
them to "allow" us to do whatever we damn please.

Because there are still a number of people out there in satelliteland
using programs that can read only the old format. If I recall correctly,
there was some discussion of this question within AMSAT, but they opted
to continue supporting those people. Personally, I consider it darn
nice of AMSAT to take that attitude.

Somewhere in Canada recently they instituted legislation along these lines,
using detector detectors. There, they confiscated them, issued a fine, and,
on the spot, put a hammer through the top of the detector..

Fortunately, they weren't confiscating the units belonging to non-residents..

Hi:

We had an outstanding weekend at N2RM in the CW contest. I ran 160 meters the entire weekend from opening to closing and operated Saturday afternoon on 40 and Sunday morning on 10. Our score (before we have gone over the logs with a fine toothed comb) was 17.58 million. This was just enough to edge out K1AR. The scores are incredibly close and if there is a missed or dropped multiplier or we have more broken calls than they, the boys from New England could come out on top. At any rate, it was a good weekend everywhere except on 10 meters. We had the most Q's on 10 but it was 900 fewer than the phone weekend. BTW, our 160 station was definitely LOUD ;-). We either had more Q's or multipliers than any of the other contenders on 160! I hope everyone gets to operate a decent, if not winning, multi-multi sometime. It's a blast! BTW, the score above is a new US record by a million points and since AR is so close, one of us will surely set a new US CQWW CW record. The highlights of the weekend (besides 160 ;-) were an absolutely stellar performance by N2AA and K2TW on 20 and KZ2S/N2ME on 40. 80,15, and 10 were either ahead or close to the other big US stations but these two bands were clear winners.

A parting thought: don't neglect 160 on the last evening of the contest. The opening to Europe and Africa was just outstanding and I got five countries and one zone in the closing 1.5 hours of the contest. N2NT reported similar results for 160 in his either 1st or second place single op unassisted run (He's close in with K1CC). I worked CN5N in the last 10 minutes!

73's
Bob

Hi,
I just ran into a situation at work and I thought that someone here might be able to help me. We have installed a number of HT and repeater stations at work. My company has two main sites in the metro ny area, one in downtown new york, and the other in rutherford.

Well, to make a long story short, the guys in new york have asked me to give up my repeater station to them. I don't really need it much as there are only a few dead spots at our location that our HT's can't cover. However, here's where it gets interesting.

I asked them what they plan on using it for. Well, it turns out, that all they really want is another frequency allocation. The vendor has told them that they can't get one unless they also get a repeater. The vendor says that the fcc won't give out additional simplex frequencies unless you also have a need for repeater frequencies. Sounds kind of absurd to me.

So I called the local fcc office. Unfortunately, all I got was a polite, but totally ignorant secretary who took a message. The "person that handles this is out in the field".

Well, I am now turning to my ham "friends" for help. Does anyone know if we are getting a crock of s _ _ _ from the vendor (probably) ? Does anyone know who at the fcc I should be calling to get this squared away ??

Thanks in advance for your help folks.

People working portable microwave stations in the ARRL v/u/shf
contests have reported that the W2SZ/1 station on Mt Greylock has
pegged their radar detector from 30 miles away on 24 Ghz. I plan to
use one next time in addition to the usual array of gear for 8 bands.

hmm... maybe mount it on a dish...

Hello fellow networkers.

I would like to establish communication with a broadcast engineer, or someone in this line who has a good understanding of the processes involved in FM stereo broadcasting. Knowledge of the internals of a stereo generator, etc. would be just what I'm looking for. I'm working on an experiment, and need a few construction tips.

Regards,
Russ Crisp

I would guess one of the sattelites. You can hear DOVE-1 with
a rubber duck antenna on an HT, though it isn't strictly speaking
a repeater.

There are a few 100 mile range repeaters (from a handheld) around here.
I don't think the coverage areas are anywhere near round though.

If you mean 2 meter repeaters, on the California coast every couple of
years when a good ducting condition settles in, one can access the
Hawaii machines... Accessing repeaters up and down the coast over the
water at distances of 200+ miles on 2 meters is common.

Ponder this folks.
We (amateur radio folk) have allocated bands from 10.0 Ghz to 10.5 GHz
and from 24.00 to 24.25 Ghz.
Additional note
Radar detector bandwidth is generally somewhere in the 100 Mhz range
ok
now we put 2 and 2 together
Since the allocation for X Band (10Ghz) falls within the 100 Mhz bandwidth
centered on 10.525 Ghz for police radar
and the K band allocation is right in the middle of our band
incidently this K band freq is 24.15 Ghz
Who is to say that the radar detectors, which can easily be a reception device
for cw are illegal for amateurs to use in any state?

You might comment to me if you have some other ideas about it.

My 2 cents:

I like spicy Mexican food as much or more than the next person. But
if you eat it all the time, it becomes as dull as anything else -- which
rec.ham.endless-cw-debate certainly has.

As regards skipping the continuous flamage: IMHO, it would be
helpful if flames were more frequently designated as such (which was a
convention I first read about in the BITNET literature when I started using
the net). Maybe I've just missed it, but I haven't seen this used often.
If the conference is kept as is -- and I can understand the reasons for
doing so -- dealing with frequent flamage might be bearable if more folks
did this.

Thanks.

HOWDY!

This is just a reminder that the Texas A&M University ARC will be running
a special events station during the afternoon and early evening of
November 29, 1990--That's right, this Thursday.
It will be commemorating the 80th burning of the Fightin' Texas Aggie
Bonfire.  Look for us in the Novice/tech portion of the 10m band or on
the 146.82  pl 88.5 repeater here in College Station.
We will also allow skeds to be made up until about 5-6pm on the following bands:
80m, 40m, 30m, 20m, 17m, 15m, 12.5m, 10m, 6m, 2m, 70cm
By next year, we should be able to conduct station with 160m and 3cm also.

A certificate shall be awarded to each station that a contact is made with
via a SASE.  Listen to CQ Bonfire for qsl information and envelope size info.
The call used will be the Texas A&M ARC call--W5AC

If you need more info or would like to set up a non 10m sked, please contact
us in one of the following ways.

Thanks
73

Maybe.  I didn't read this posting until 0210 UTC Monday.  At my QTH WRNO
was putting in a fine signal (4 out of 5) while WWCR was buried underneath
some terrible interference--the nature of which I could not determine.
The QRM was so terrible I couldn't make out anything being said. This
was true on both the FRG-8800 hooked up to the outdoor antenna and the
ICF 2010 on the telescoping antenna.

Did anybody else hear this?

Does this mean Hauser will no longer be heard on WRNO where his show aired
a number of times a week? (My favorite daily double IS on Thursday night
local time where his program aired on WRNO at 0130 UTC Friday immediately after
Radio Nederland's Media Network.)

I have been following the discussion of the story of batteries and Icom gear with interest.

Does anyone know if the ICOM IC735 needs reporogramming if the battery dies?

My manual does not mention anything about this, it only says to replace it if the display goes crazy.

Please email replies to me. Thanks in advance.

--- MONTHLY SOLAR TERRESTRIAL REVIEW ---

October 1990

Report Issued In-Part from Data Released by the
Space Environment Services Center
Boulder Colorado

MONTHLY ACTIVITY SUMMARY AND SOLAR CYCLE OUTLOOK NOVEMBER 1990 - MAY 1991

We are now in month 50 of solar cycle 22. Averaged activity levels and solar indices were up again in October compared to September, but not nearly enough to affect the prediction that July 1989 was in fact the solar maximum of cycle 22. The largest increase was observed in daily sunspot number and the monthly average was up almost 33 points over September values. The prediction model used for smoothed sunspot number shows that there is still a slight statistical possibility that solar maximum is yet to come. However, for this to be true, the activity and solar indices would have to reach the levels obtained in August 1990 and maintain that level for a number of months. If time proves July to be just a relative peak of activity and not the solar maximum, then the regression model predicts late spring 1991 as the next probably candidate. However, at this time we do not see any indication of the kinds of activity that would be necessary to unseat July 1989 as solar maximum of cycle 22.

Flare activity ranged from low to high during October. There were a total of eleven M-class flares reported during the month. The two largest, an M8/1N Tenflare at 18:06 UT on 20 October and an M3/SF at 06:02 UT on 21 October, originated from Region 6311 which became quite active on 20-21 October, producing three M-class flares before it crossed the limb late on the 21st. There was a very slight proton enhancement at satellite altitudes which began around 09:00 UT on 23 October, reached a maximum of 4 pfu at the >10 MeV range at 14:25 UT on 23 October, and lasted about 36 hours. Although no solar event can be pinpointed as the cause of this proton enhancement, its signature suggests that it originated as an east limb event.

Geomagnetic activity ranged from quiet to minor storm levels at mid latitudes and quiet to severe storm levels at high latitudes. The two most disturbed days were 10-11 October when mid latitudes experienced minor storm conditions and high latitudes experienced one day of severe storm and one day of major storm conditions. Although no individual event can be suggested as responsible for this activity, it is possible that the interplanetary magnetic field was aligned southward, allowing solar wind energy to be passed efficiently to the magnetosphere, in essence, enhancing the effects of earlier solar disturbances.

Radio propagation conditions during the month ranged from very poor levels at high latitudes to very good levels at low latitudes. The most disturbed period occurred in conjunction with the minor geomagnetic storm of 10-11 October. Significant auroral flutter and fading caused poor HF propagation over most paths.

SIX MONTH SOLAR CYCLE OUTLOOK

Prediction models indicate another small increase in the raw solar indices for November, still not enough to affect July 1989 as solar maximum. A drop in December and a leveling off through the first couple of months of the new year are also predicted. No great deviation from the activity levels of the last two months are foreseen at this time.

Radio propagation conditions over the next six months look relatively good. No significant changes in overall conditions are expected, excluding the normal seasonal variations. Approximately one minor to major geomagnetic storm can be expected every month or two. Therefore, between 3 to 5 significant periods of degraded propagation conditions should be anticipated over the next six months, provided current models are accurate in predicting pulses of solar activity and recurrent phenomena.

The occurrence of SIDs/SWFs should persist throughout the next six months. Present solar models suggest that December through January will likely be the least productive months in terms of solar flare and SID/SWF activity. Also, a decline in MUF is anticipated for December and the first part of the new year, coinciding with decreased levels of ionospheric ionization.

VHF propagation should remain mostly normal throughout the next six months, with decreased probabilities of DX contacts in December and January. Reduced MUF will also make DX openings on 50 MHz somewhat unlikely during these months of expected decreased solar activity. Although reduced MUF's are anticipated, there remains a moderate probability for some potential auroral backscatter communications on VHF bands during periods of minor to major geomagnetic and auroral storming. Middle and high latitudes will benefit the most during these periods.

22 Oct	0611	0641	0740	M2.9	SF	S08W50	6322		1+		

NOTES:

- Xray Flare Classes (weak to strong): C, M, X (with sub-categories rated from 0.0 to 9.9 in each class).

- Optical Flare Classes (weak to strong): S, 1, 2, 3, 4 (with an attached figure identifying brightness: F-Faint, N-Normal, B-Brilliant).

- Locations are given in latitude and longitude as measured from the central solar meridian.

- Sweep Frequency Intensity represents the intensity of detected solar radio frequency bursts (bursts sweep over large frequencies). Type II and IV almost always represent ejection of solar material through the solar corona and into interplanetary space. Intensities are rated from 1 to 3+.

The SARSAT satellites broadcast information received downwards to a ground station, if one is within the footbprint. Most of the processing is done on the ground. The satellites have ability to store (and forward) data burst information from the new 406 Mhz. ELT's.

Since there are several satellites, many ground stations, etc. putting the information together from several satellite passes is done by the ground network rather than a "Master" satellite.

I have technical data at home, I will look up the frequencies. Don't expect to be able to listen with your PRO-2004.

ARRL BULLETIN 48 ARLB048
FROM ARRL HEADQUARTERS
NEWINGTON CT NOVEMBER 20, 1990
TL ALL RADIO AMATEURS

BALLOTS HAVE BEEN COUNTED IN THE SECTION MANAGER ELECTIONS FOR
WESTERN PENSYLVANIA, EASTERN MASSACHUSETTS, AND SOUTH CAROLINA.
THEIR TERM OF OFFICE BEGINS JANUARY 1, 1991. THE RESULTS ARE AS
FOLLOWS:

IN THE WESTERN PENNSYLVANIA SECTION
BERNIE FULLER, N3EFN, 465
ROLF PETER, WA6HBN, 277
MR. FULLER WAS DECLARED ELECYED.

IN THE EASTERN MASSACHUSETTS SECTION
MORT COHAN, KA1IU, 565
BARRY PORTER, KB1PA, 548
MR.COHAN WAS DECLARED ELECTED.

IN THE SOUTH CAROLINA SECTION
CHARLES MOELLER, N4FVU, 339
JACK PARKER, K5CVD, 203
MR. MOELLER WAS DECLARED ELECTED.

THREE OTHER SM RACES WERE NOT CONTESTED. THE FOLLOWING WERE
DECLARED ELECTED.

IN THE SOUTHERN NEW JERSEY SECTION
BRUCE EICHMANN, KE2OP

IN THE MISSOURI SECTION
BILL MCGRANNAHAN, K0ORB

IN THE NEBRASKA SECTION
VERN WIRKA, WB0GQM.

On behalf of myself and Mike, WA0VNH, I'd like to request some info.

We're both looking for info and/or mailorder source(s) for a divide by
10 prescaler chip which will work up to 500MHz. Mike believes the Fairchild
11C90 will do the job, but we don't have a source for it.

If anyone has a better chip suggestion, some technical data, or a mailorder
source for such components - we'd be glad to hear of it.

Thanks in advance.
(I will summarise to the net, if anyone expresses an interest).

>"Cogito, ergo es."   Occidental College Computer Networking

The answer is *yes*!
The TH-75 is modifyable in both TX and RX for extended frequency coverage on
both 2m and 440. The receive coverage appears to be for the entire bands ie
136-175 and 315-512 (I don't have my radio on hand to say exactly). This
extended RX is obtained by cutting the jumper wire on the control unit.
The extended TX mod requires the removal of a diode. I figured this out from
the schematic and I only know that it works. It may not be the *correct* way.

After any mods, reset the microprocessor (after writing down the info in the memories). I find that the HT seems to go into mad fits of beeping which disappear if I turn it off, then on. This happens only rarely and is probably a defect not a side effect of a mod.
Incidentally, I don't know how well the radio performs at the ends of the respective bands. The PLL appears to have some difficulty locking up there ie: band scan appears to be slowed.

The PLL would probably have to be readjusted for coverage above 455 MHz since the PLL seems to be aligned for the lower portion of the band.

I don't know what use you have for the mods. I did it partly as a curiosity, and partly because the ham band is bigger than the TX/RX capabilities of the HT as sold. I haven't found any FM activity on 420-440 MHz, by the way.

The mods are deducible from the manual. Just look closely at the table of which diodes are in and out for which models.
Feel free to contact me, provided you don't plan to do anthing beyond the law.
(In which case, don't do anything *too* naughty and leave me out of it)

Incidentally, it seems that most HTs are modifyable without much difficulty.
Hope I answered your questions.

There have been several postings on here lately about the battery in some ICOM HF radios that holds memory. Some folks fear that the battery will wear out in a few years, and they sill be stuck with a microprocessor controlled radio with no "brains."

I talked to Bill Everett of ICOM today. He said that the batteries in ICOM radios (I'm NOT talking about the battery that POWERS your HT!)

have a predicted life of over 15 years. If you want to replace yours before it runs out, and are afraid of losing memory, float a power supply across the battery that is set at about the same voltage as the battery. Then remove the battery, and replace it. Keeping voltage on it will keep the memory alive.

If you want ICOM to do it, you can send in your radio, and for $25 they will replace the battery. This includes parts and labor.

If you want to contact Bill Everett at ICOM, his email address is
76702.753@compuserve.com

He has some trouble replying to internet mail though. Listing a couple of variations of domain addresses could help if you want a reply.

Hello hammers,
   (PLESE E-MAIL ANY RESPONSES I DO NOT GET THIS GROUP/LIST, THANKS)
Are any of you out there also into Citizen's Band? If so, what can you tell
me about good (car) brands, what type of antenna to use, how much I sacrafice
going with a coiled 4ft vs a straight (108?)" antenna, how many users are
there really on the roads, etc, etc, etc.
Thanks for your help,
~r ~/.signature

Piffle! A good EDMEESE type program should catch 99.9% of the possible improper messages. As long as we make a good faith effort to comply, the FCC won't nitpick if an occasional clinker slips through.

Maybe, but I've had great luck on commuter trains using a twin lead j-pole suction cup mounted to the window.

In the previous posting I forgot to mention something the WAZ award manager (K1MEM) told me. I asked him why the WAZ-SSB awards are numbered sequentially, while there is no such numbering scheme for the WAZ-CW ones, which are numbered along with the WAZ-mixed ones.   That is, if you do a WAZ entirely on CW, you get the same certificate as for a mixed-mode award except that it has "CW" in ink at the bottom.   There are historical reasons for this (going back a *long* way). The news is that they are just about to start an all-CW WAZ series. Read the footnote on page 50 of the Nov CQ Mag for more information (basically, you make QSOs starting Jan 1991, and the QSL cards must say "two-way CW"). There are some other changes to the WAZ program that are listed in that article.

Incidentally, to those of you who want to fragment wreck.ham-radio even further, where would the above posting go, in your view? It mentions the dreaded CW, even advocates its use on the ham bands - does that mean it belongs in whatever.legal?   Do Phil Karn's quantitative comparisons of the various communication modes belong there too? What about those of you who are disturbed by mention of contests, DXing and so on?   How about all those articles about what sort of antenna to use in various circumstances? We are not all interested in all the postings that appear here. I find it very easy to skim all the articles in r.h.-r. and I suggest that if we need another subgroup or groups then this one should be renamed ham.radio-ostrich, for all those who would like the group to be like a nice pleasant tea party with no disturbances to their own set way of doing things. Or rec.ham.75m?

Wadda ya do when...

You call CQ (cw mode) and station XYZ answers - absolutely gorgeous signal. You finish the first exchange, having told him he's RST 599 plus 20 into Timbucktwo and then send it back to him KN.

Now XYZ comes back for his/her first exchange. After the first couple of words or so you soon realize that this is not gonna be one of those "vy fb qso's" cuz XWZ's fist is obviously afflicted with both a lisp and a stutter and you'll have learned an entirely different version of morse by the time this qso ends :-)

So... I'd like to poll the net and request responses which answer the question - "How do I tactifully get out of this mess without pissing this guy off?"

Of course as the originator of this posting I get the obvious one which goes something like... sri om but the QRM es QRN are murder on this end...

73...

Originator: gwalsh@kilroy
Nntp-Posting-Host: kilroy.jpl.nasa.gov

Here is the complete list of mods that are know to date for the Kenwood TH-77A Dual Band hand held:

From the factory, it can receive 138-174MHz and seems to do it quite well with the supplied rubber duck antenna. It also can receive 438-450MHz and, likewise, does this quite well too! One very interesting feature of the TH77A is that it can do *DUAL* UHF receive! To do this it uses the VHF receive section and you have less sensitivity, but I really haven't noticed much signal degredation at all.

Kenwood has made this radio compatible with the new ICOM S-Series radios from what I can tell. It has DTSS (Dual Tone Squelch System) which means that your radio will not break squelch until it hears a particular sequence of three DTMF tones (ICOM has this also and they call it Coded Squelch which also use three tones). The TH77A also has a paging function that works *exactly* like the ICOM paging. You program the radio with a personal 3 digit DTMF code and someone pages you by transmitting YOUR 3 digit code, followed by a * character and then their own 3 digit code. The ICOM will start to ring to let you know that you have been paged and display the 3 digit code of the person that has paged you. The TH77A will beep once and open squelch as long as the person that paged you does not drop carrier (I prefer the ICOM method for this part, but there is a work around that I will mention in a bit). One thing the TH77A does at this point is bring up a timer so you know how long its been since you've been paged. Maximum time is 99 hours and 99 minutes. Let's see if your battery can hold out that long! The workaround so the TH77A will ring, rather than just beep and open squelch is to put the radio in the pager mode AND also put it in Tone Alert. When you get paged... the radio will "beep beep (pause) beep beep" five times and start up the timer. Kenwood has provided two different types of BEEPS for you. The second type is to ring like an electronic telephone. This one *REALLY* sounds nice!! For those of you that like autodial memories, there are 10 memories that can store 15 characters each. There are 40 regular frequency memories in this radio and you can make them all UHF if you like (no restriction).

NOW! On to the *EXTRA* capabilities (there are other BASIC functions that I didn't mention, those were just the highlights).

After making a few modifications to this radio, you can get it to do the regular stuff that the IC24AT will do, such as AM aircraft, expanded UHF (400-512 depending on PLL lock) and 800-950 (again, depending on PLL lock) in addition to cross band repeat.

HOW DO YOU DO THIS!?

Easy (if you've got a steady had for removing a chip resistor!).

Open it up. There are 3 screws visible on the outside and 4 more underneath the battery pack. Unlike most radios, this one doesn't have a spring for the battery release switch. It gets spring action from the metal plate that you will remove when you take out the four screws. I love it!

Anyway, the area you will be working in is on the control board which is fixed to the front section of the radio. In particular, look for the yellow electrolytic capacitor (its yellow in mine) that is at the dead center of the board (there are two IC's, one above this and 1 below this). You will have to remove the electrolytic capacitor (C124) and set it aside for a few minutes. You will be putting it back afterward. The reason for removing this is so that you can remove a chip resistor that is underneath it. To avoid tearing the flex board foil traces, do not bend the leads of the capacitor. There is a green wire that is connected to one side of this capacitor. If you disconnect one side of this green wire, you will get RX from 400-512 (PLL lock depends on the radio, but you can DIAL from 400 to 512). Orient the radio so that the volume controls and BNC are at 12 O'Clock on your table (farthest from you) and the bottom (where the battery connects) is at 6 O'Clock (nearest you). In the area where you removed the capacitor, you will see a blank space where there could have been a chip resistor followed by two chip resistors side-by-side and in the next row below that, you will see 3 more that are side-by-side. There is one to the left of these two rows that is kind of off center. Now, there are three ways to configure this radio at this point:

1 - With one side of the green wire pulled, you will have 136-174 RX, 400-512 RX. If that's all you want, you are done.
2 - By removing the rightmost chip resistor (R129), in addition to keeping one side of the green wire disconnected, you will have 136-174 RX, 400-512 RX, 118-136 AM RX, 800-950 RX.
3 - By removing both of the chip resistors, in addition to putting the green wire BACK where it belongs, you will have 136-174 RX/TX, 400-512 RX/TX, 118-136 AM RX and 800-950 RX.

All three of these options include, of course, putting the electrolytic capacitor back in place afterwards.

NOTE! ONCE YOU START DOING THIS STUFF, YOUR MEMORIES AND POWER ON SWITCH CONFIGURATIONS WILL ALL BE LOST! MAKE A NOTE OF HOW YOU ARE SETUP BEFORE YOU BEGIN!

Layout shown with electrolytic capacitor C124 removed

The best way to do this is to heat up both sides of the resistor and push it out of the way with something small. At least this was the best way for me! Once it's out, put the capacitor back in place and close it up. (Put the green wire back also, if you are making the out of band TX mod too!)

TO OPERATE THE NEW FEATURES

To receive AM aircraft, get the VHF side in the main band and hit the ENT key twice to go to the VFO. Once you are in the VFO, hit the UxU key twice. Once for dual UHF receive and the 2nd time for AM (118-136).

To receive 800-950, get the UHF side in the main band and hit the ENT key twice to go to the VFO. Once you are in the VFO, hit the UxU key once.

To enable crossband repeat, hold down the SUB BAND UP ARROW key while turning on power. To disable, do the same thing again. Kenwood says that both bands can contain shift information but only one band can include an encode/decode tone.

One more thing. The POWER ON + 8 KEY that allows you to select the kind of memory recall will be a bit different. Now, you will have an extra option in the right side of the display. E1 or E2 which may be selected with the VFO control on the top of the radio. E1 mode will allow you to automatically make the radio switch to AM or switch to the 800MHz stuff as you use the VFO knob to move through your memory channels. E2 mode will skip over any memories that are AM or 800-950MHz. In E2, the only way to recall one of the *special* memories is to go to the VFO, hit the UxU key to go to AM or 800MHz and then recall one of these memories. Personally, I have mine in E1 and don't know any reason why anyone would want to be in E2, but its there if you need it!

The Kenwood modification sheet says the following about AM sensitivity:

> While the receiver sensitivity is neither specified nor guaranteed for the AM range, the sensitivity is typically less than 1uV for 10dB signal plus noise to noise ratio between 123-131MHz. The band edges, however, measure between 8-20uV for 1dB S+N/N ratio.

SOME PERSONAL OBSERVATIONS

My radio seems to have a hole in it in the 800MHz band. I get this beeping sound when I try tuning between 864-875MHz (I believe the TH77A beeps when it can't lock). Also, the sensitivity could be better around 483MHz (local Sheriff). I did notice that using the dual UHF receive and tuning to 483MHz was better than using the straight UHF receive. (Remember, the dual UHF RX uses the VHF section with reduced sensitivity. Well, its reduced in the amateur portion, but seems to be enhanced out of the band!) At around 506MHz (Los Angeles PD) its VERY weak. I could barely hear anything WITH an outside antenna. Maybe some tweaking inside could improve this (I haven't really looked for the VCO yet).

Many thanks to Pontus Hedman (rph@sq.com) for helping me put this information together! Thanks also goes out to James Dugal (jpd@pc.usl.edu). By the way, Pontus did mention that checking the input frequency was a bit annoying. You have to hit FUNCTION SHIFT to get the radio to REVERSE and listen to the input. I agree!

Anyway, hope this information helps you get more from you new toy!
Its a *REALLY* nice radio!!

As I recall it, ham transmissions are supposed to be "remarks of a personal or technical nature" and not political quasi-broadcasts. I also find it pretty arrogant to assume that you're the only one out of half a million or so hams who is doing something worthwhile on the bands.

>> The ham who commented about it ... found ... that it was pretty

Many hams are argumentative, many Usenetters are argumentative, and Usenet hams are really argumentative. The question of which is the larger group, the arguers or the non-arguers is a valid concern. I support the separation of rec.ham-radio into an argumenative group and a bland lifeless noncontroversial group. It would be easier to manage a subgroup named rec.ham-radio.bland than a rec.ham-radio.legal and would tend to keep the crosspostings to a minimum in the rec.ham-radio base group. Think about it.

>David L. Hirschberg

This antenna should work, not great mind you because you mounted it so close to the building, but it should work. Now the key question becomes how did you connect the coax to the antenna. A dipole is two pieces of wire with an insulator in the center. One piece of wire should be connected to the center conductor of the coax and the other piece of wire should be connected to the shield of the coax. The two pieces should not be shorted together. At the radio end of the coax, the center conductor should be connected to the center pin of your coax connector and the shield should be connected to the outer shell of the connector. It sounds like you have shorted the coax at one end or the other and that's preventing any signal from getting from the antenna to the radio. Recheck your connections, your design is sound.

8mm tape are typically 120mins long with no necessity to reduce speed.
To get the same portability, the VHS-C is comprimised in terms to record time.
They typically get 20min in standard play and 1hr in slowest speed, and

naturally the worst video image. Even in its fastest speed given camcorders
in the same price/feature catagory, 8mm is still better than VHS-normal, abeit
only slightly so...

There are commercial cards available for doing this, but you are on the
right track. You need a parallel port to drive the relays through the
transistor drivers provided in the 5400 and you need some form of A/D
conversion to read the position pots. The pots are powered by the control
box through a 7808 voltage regulator and a dropping resistor so some
hacking of your game port, which is also powered, will be needed to
make them talk without smoke. Amsat's Instatrack and Quiktrak will
drive the rotors for you after you customize the interface drivers
for your hardware.

>   Anyone have any experience with this?

Icom demonstrates this at all the shows. It seems rather useless though
since, without a keyboard, you can't issue the necessary commands to

your data controller to get it to monitor the signal you are interested in. Of course two way use is impossible without a keyboard.

> I have a Kantronics TNC-2 with rom update 2.83 (dated 1988). Is

> the 470 is the neatest handheld on the market.

I assume you meant a Kantronics KPC-2 and not a TNC-2. These are totally different animals. The KPC is a good TNC but is neither firmware nor hardware compatible with the TNC-2. There is not a dedicated KISS rom for it nor will you be able to use the satellite modems or high speed modems that are available for the TNC-2 since the KPC-2 doesn't have the TAPR TNC-2 modem disconnect nor the TNC-2's Z80 architecture. With that in mind, get the upgraded firmware, there are substantial improvements in the later code. Using the KPC with an HT requires that you use an external antenna on the HT. The case of the KPC is not a very good shield and you have to get away from it. You can also tweak the crystal oscillator in the TNC to try to move the hash off your operating frequency. Another approach that works is to use long audio lines between your KPC and your HT. About a dozen feet of separation seems to work ok. I've found that the tin boxes MFJ uses in their 1270 series are a much better shield. The MFJ 1270, 1270B, and 1274 are TAPR TNC-2 compatible. The 1278 is not.

> Since we have satellite capability in the station, what PSK modem is
> the best? Is there one that we can piggy-back on an existing TNC,
> esp MFJ 1278 or TNC-2?

The kit from Radiokit works well with a TNC-2. Paccom has a similar unit assembled, and TAPR also has a kit. I'm not sure that you can interface any of these to a MFJ 1278, but any true TNC-2 compatible TNC will work.

I picked up a copy of the Washington Post today and noticed
that fellow satellite chaser Ted Molczan made the 'Around the Nation'
column (Page A16 Monday, November 19,1990). Apparently Ted noticed
something 'unusual' about the Shuttle and it's classified payload.
The article suggests that the Shuttle crew may have had to rescue
the spy satellite but NASA has remained silent on any possible problem.
Nice going Ted...keep 'em honest.

Some very good reasons were included when the original idea was posted.
I expect that even more good reasons will be added to the list when formal
discussion begins.

>their reasons for such. I get the feeling that some folks are outraged by any
>sort of controversy - they call it "flaming". Everything that is not milky

I do not feel controversy and flaming are the same thing. Controversy
may lead to flaming when emotions take control away from ones ability to
reason.
I suspect that even reasonable people get tired when any controversy repeats
the same arguments ad nauseum.

>Come on folks, let's not become too stultified. Sure, the code-no code

>are the spice of life. Even the Russians are able to disagree now without

In your opinion, but not necessarily others. We will see what the majority think soon enough. The object of this idea is not to banish anyone to "Siberia"...

Well, I missed the first half of it, but the second half was pretty good, even though more than 1/2 the folks had already left! Jay Maynard was running as net control when I got there. I know that John Moore had been doing it before that.

I will not be on this coming weekend, but dont' let *that* stop you! (or maybe I should say "So if the threat of my being their has kept you off, now's your chance!" :-)

> shunned by the enlightened - right?

Does humour imitate life?

Because of all the "It's illegal" carping of the narrow minded I and others have suggested that we create wrecked.ham-radio.lawyer etc. This has been a quiet giggle for the past year or so. In fact, just for giggles I have even created a newsgroup in my active file called rec.ham-radio.lawyer.

It is interesting to note that the dull dreary goody-goody attitude of the narrow minded has lead to the suggestion that they get their own forum. But at least this will give them an opportunity to drone on endlessly about matters legal and bureaucratic.

Of all the postings I have made here over the past 18 months, the one that got the most response was a scenario I fabricated to excite the armchair lawyers. I invented a scenario where I was on an auto-patch and someone put me on hold. While on hold, a song and two ads were played over the repeater. The response to this posting went on for weeks. If I ask anything slightly technical, it is usually ignored.

Maybe we should just call this group:
rec.ham-radio.humourless-bureaucrat

Why feed these people? Why don't we ignore them? Let's treat them with the contempt which they deserve. Giving them a news group will not stop them posting to rec.ham-radio saying: "Nja-nja, you can't do that. I'm going to tell the FCC about you."

Some of my most instructive hamming was illegal. Yes, I will even admit to running illegal phone patches on 2M and 23 cM between Sweden and Denmark. So I suppose I am now an international felon. I have even worked Germany, Holland, Belgium, Denmark and England from a commercial aircraft using a 2M walkie-talkie. So want to know if you can do this from a plane? Sure you can. Did it crash? Obviously not. Did I have the captains permission? Well on some these jaunts the captain (an SM) and I took turns working the rig. But 1,125 posters here will tell you that the plane will crash and you will go to hell after you have been to prison.

We now return you to the "You can't do that" postings that clutter this forum.

P.S. Loved the posting about not being allowed to use radios on Amtrak. Very funny.

I was talking to John Moore NJ7E today, and he asked me how the callsign project was going. I told him, and he panicked. (Well,almost) So, he suggested that I remind everyone that the callsign project is currently underway (I await the data from the NTIS which I ordered a month ago)!

Get those cards and tapes in the mail, please! :-)

(Why did he near-panic? Because I told him it looked like the money
I had planned to spend on a dual-bander for the car would go instead
to pay for the FCC database... oops! :-(

I don't see the point in having another newsgroup. If the purpose
is to be what the name says -- discussion about legal aspects --
then I'd say it is directly relevant to ham radio in general and
there is no sense in sticking it out in a group of its own.

If the purpose is to segregate flaming (as opposed to real discussions)
then (a) the name is wrong, (b) it won't work anyway. The code/nocode
meatheads are not likely to have the good sense to keep their flaming

in the rec.ham-radio.useless-flaming newsgroup!

CW: A Morse Code Practice Program for the HP-48SX

CW is a directory containing several programs and variables which comprise a capable Morse code practice system for the user. The program can send code using the beeper at speeds slightly over 20 words per minute continuously, without encountering delays due to calculator "garbage collection". The user can set the overall speed and element speed independently, or can manually set the timing and delay for each element type. The program will create, send, and display five character random code groups, or the user can store any size string in a variable to be sent and displayed manually. The following descriptions explain the programs and variables and their use.

CGR (Code GRoups) is a program which creates a string of 25 five character random groups, sends them using the present speed parameters, and then displays them so the user can check his copy. The characters are selected from a string in CGR which contains all the characters and prosigns used in amateur radio license tests. If the user wishes to practice only certain characters, this string can be changed with 'CGR' RCL EDIT or 'CGR' VISIT and the groups will then include only the characters from the modified string.

SPD (SPeeD) is a program which calculates and sets the various parameters affecting the timing of each type of element. The program prompts the user for the overall speed in words per minute and the element speed, also in words per minute. After entering these two numbers on the stack, the user presses [LSHFT] CONT and the program stores values in ST, LT, ET, CT, and WT. SPD will not signal an error if speeds are set too high or if element speed is less than overall speed, but one of the values in ST, LT, etc. will be set to zero or negative and CWO will halt or hang. Calculator speed and overhead as well as time to do the garbage collect operation limit the speed to slightly more than 20 wpm if overall and element speeds are the same. If the element speed is set faster than the overall speed, somewhat higher speeds can be reached, 26 wpm overall with 29 wpm element speed being about the maximum in any case. The speed will be quite accurate, within 1% or so in most cases. The user can measure the speed if desired by storing the string "paris paris paris ..." in TXT and using a stopwatch to time from the first element of a word to the same first element a few words later. Divide the number of words timed by the number of seconds on the stopwatch and then multiply that by 60 to obtain the speed in words per minute.

CWO (CW Output) is the program which actually sends the Morse code using the beeper. CWO sends the characters contained in the string TXT. TXT is set and CWO is called automatically by the

CGR program, but the user can set TXT and then execute CWO manually to practice something other than random code groups.

DSP (DiSPlay) is a program which displays a screenful of characters from the TXT string. CGR calls this program to display the code groups it creates and sends. If TXT is more than one screen long, DSP halts after each successive screen. The user can view the next screen by pressing [LSHFT] CONT.

TXT (TeXT) is a variable which contains a string which will be sent as Morse code by the CWO program. Any ACSII character with decimal code 32 through 128 can be contained in TXT. Characters that have no representation in Morse code will be sent as a space. Note that some of the radio prosigns which have no representation in ASCII have been placed on some of those characters. For a listing of these, see the CODE variable. Note that lower case characters are folded into upper case.

CODE (CODE) is a variable which contains a list of short programs, one for each character. CWO disassembles this list on the stack before sending so that it can access the character codes much more quickly than by other methods. Prosigns which have no associated ASCII character are rather arbitrarily placed on the following characters:

understood (SN)	!
error (HH)	#
paragraph (AL)	*
starting signal (KA)	[
wait (AS)	\
end of work (SK)	]

ST (Short Time) is a numeric variable containing the basic element (dit) time in seconds, normally set at 1.2/WPM.

LT (Long Time) is a numeric variable containing the longer element (dah) time, set at 3*ST.

ET (interElement Time) is a numeric variable containing the delay time between elements. This is generally set at the same value as ST, less the calculator overhead time between elements, .04 sec.

CT (Character Time) is a numeric variable containing the delay time between characters. This is usually set to the same value as LT, adjusted for various calculator overhead times in the program.

WT (Word Time) is a numeric variable containing the delay time between words. This is normally set to 7*ST, adjusted for various calculator overhead delays.

FR (FRequency) is the frequency in hertz of the beeper.

Set at 500 hertz, but the user may store any value which suits individual taste.

S (Short beep) is a program which actually sends a single dit element. The user will not use this program.

L (Long beep) is a program which actually sends a single dah element. The user will not use this program.

W (Word wait) is a program which generates the delay for a space character. The user will not use this program.

How about rec.ham-radio.tech? Leave the endless discussions here rather
than try to get them to move.

>Q: It is possible/how does one modify the Kenwood TH-75A to recieve
>   beyond 450MHz up to at least 465? Is there a matching Xmit Mod?

Yes. I don't recommend doing the mod without the service manual in front of you.

Referring to page 54 of the service manual, open the radio by removing the screws above and below the PTT, the one screw on the opposite side of the radio, and the two front battery plate screws. Lift the front assembly off. Looking at the board in the front assembly (the control unil board), near the bottom left corner of the main CPU is a jumper wire. It's the only one on the board. Cut it. In the same location of the wire are three diodes in this configuration:

```
                   D4
                    o D3
                    r6   o
                    r34  D2
```

You need to remove D4. The resistors are shown here for reference, and the "o's" mark the point which the wire connects. This will, BTW, give you all the VHF out of band TX/RX coverage also.

This will give you coverage (where the VCO locks) from about 380MHz to 458MHz as it sits. The actual passband of the front end is about a 35MHz window in that range. The next step is to re-align the VCO for your desired frequency, and also the front end if you plan on hearing anything above 458. You MUST have the service manual to go digging for the VCO and the front end trimmers. It's not too difficult to get to, but there are a LOT of screws to remove, and you will need to re-connect the PC board jumpers so you can turn the radio on while having the boards lying out on your workbench.

It is possible and relatively easy to re-align everything for coverage from 435 to 475 MHz RX/TX. It works well with adequate power out and good sensitivity across the whole range.

This mod is posted without any written or implied guarantee from either me or Kenwood, and you perform it at your own risk.

Netperson Trey WN4KKN will be operating ZP0Y during the CQWW contest this weekend. He is already in Paraguay, and I heard him on 10 and 15m within the last hour. Trey will also be doing some WARC band operation before and after the contest. QSL non-contest contacts (i.e. WN4KKN/ZP5) via AA5BT. For contest QSOs (ZP0Y), QSL via ZP5JCY, which means via LU8DPM - a slower but still reliable route.

Give Trey a call on as many bands as you can in the contest!

Re: two 1/4-wave verticals phased 90 degrees:

Note that the feedpoint impedance of the two antennas will not be the same. If you just run a 1/4 wave feedline between them, then even if you do somehow get the total feedpoint impedance to equal 50 ohms, you almost for sure will not have equal currents in each antenna.

Here's how I would do it. Build a matching network at the base of each antenna (PI-network, or whatever). Match each antenna to 50 ohms (with SWR meter) with the other antenna disconnected (open). Now connect each antenna to a common "Y" feedpoint, using 50-ohm coax. Make one coax 1/4 wave longer than the other. (Don't forget velocity factor.) Connect a transmitter to the "Y". Now, with an SWR meter at the base of each antenna, adjust each matching network for 1:1 SWR. There will be interaction, so you will have to iterate a number of times.

When you are finished, you will have a 25-ohm feedpoint impedance at the "Y", which can be matched to 50 ohms with another matching network. Each antenna should now have the same power being radiated, so the cardiod pattern should be correct.

Hello all,

I would appreciate hearing from anyone who has had experience with the Heath HW-24 series mobile rigs. I am interested in purchasing one as a gift (for an uncle), but would like some input before sepending such a large amount of money.

BTW, I think the version (made by Standard) in Japan is the C5200D.

Please send your responses directly to me: asplund@girtab.usc.edu

Thanks in advance for the help.

>how to design projects using this (obviously) useful microprocessor.

I don't think this is much different from "construction" articles in other mags. I see basically the same kind of projects in Popular Electronics and Radio Electronics. Anytime an LSI chip is used in a project, the inner workings of it may be proprietary, so that the publisher can't divulge the "how it works" details even if he wanted to. We use lots of chips in projects without really knowing what's going on inside of them. If you think of them as "functional blocks" that you need to accomplish some portion of a larger project, then there's no need. The worst case occurs when the whole shebang in on a single (perhaps proprietary) chip, In this case, there's not much we can do except to call or write the chip mfgr and ask specific questions about what we want to modify.

Thanks for these postings. I've been wondering if I should try to build one of these keyers. I've been burned in the past by projects that seemed great, only to find that they took weeks of troubleshooting to correct errors made either by the author or the editor. I'm glad to know that this project is free of such errors and that the parts really are available.

Well, you could send a SRI HV TO GO BT TNX QSO. 73 ES BCNU....

BTW, what's wrong with a using a little patience? If the idea is to communicate with other Hams while increasing BOTH our skills, I see no reason to beg off so suddenly. You could also ask how he's sending at such a different fist. IMHO most wouldn't mind telling you that they were not too good on the key and wanted to make some of the QSO easier for you. Right after that, they may also say that they are working to improve their fists.

(Derek, if you're reading this, "he" is being used in accordance with the rules of English, and not as an insensitive slight to our female Hams)

Let's give 'em some encouragement, not harassment.

Tad,

Like you, as soon as I layed eyes on that article, I knew I HAD TO HAVE this keyer. I sent in my $48 (yes, I also thought it was a bit pricey) on Saturday, November 3, had the parts kit Friday, November 9, and fired it up Thursday, November 15. The "OK" in CW from the microprocessor is quite a surprise the first time (hi hi). I've tried just about all the features, and I'd give it very high grades. Being able to set and read the speed and being able to switch keyer polarity are the most useful. I tried using the "break" feature in the memory that allows insertion of variable info into the string (such as RST or call signs), but I found that you'd better not make a mistake or you'll find yourself doing the rest of the exchange with the paddle.

As for the case, I used a Radio Shack project case (5" X 2 1/2" X 1 1/2"), and it barely fit. The circuit board is tiny, but the batteries, speaker, stereo jack (for the key paddle), pot, four control switches, and phono jack (for the output) all take up room. I now see why the case in the QST article is exactly twice the size! I ended up mounting the switches and the circuit board on the left half of the aluminum face plate which forms the top of the otherwise plastic case, the speaker on the right half of the face plate, the battery pack below the circuit board (and glued to the bottom of the case), and the pot and two jacks below the speaker. I used a 1 1/2" speaker with the pot in front, the paddle jack on the right end of the case, and the phono jack output on the back side.

Its a great keyer. I have had no RF problems whatever, even running next to my Dentron KW amplifier.

I enjoyed your note and would like to hear if anyone else has built the keyer.
 Should be great in the next CW contest!

73

The '1278 can be _MADE_ TNC-2 compatible by pulling out a couple of ICs and replacing them with DIP headers. This is described in appendix E of the current (Revision 9) manual. Then a NET/ROM etc can be plugged in. I assume that this throws away all the '1278-specific features, in particular the non-packet operating modes...

     - Jerry Kaidor, KF6VB

I'm not sure if this went by and I missed it, or if it exists, but is
there a mod for the IC24 to allow TRANSMIT on 430 through 450 MHz?
thanx, and 73, doug.

well, I sit corrected :-)

I talked to John again today and he took issue with my description of
what happened. Yup, he is right - he did not panic. Sorry, I got
carried away... (Does poetic license extend to usenet news articles? :-)

So, let me set the issue straight:

John DID NOT PANIC.

Thanks.

(and i vote YES YES YES a Thousand times YES (well, at least one yes, anyway),
to Jay's suggestion of rec.ham-radio.legal)

]   John DID NOT PANIC.

Thank you for setting the record straight!

However, John IS concerned that Rusty will not be able to buy his
dual bander, because he is way short of covering costs on the
callsign project. I'm also concerned because if Rusty loses his
dual bander, he sure isn't going to do the call sign project again!

So please - get in on the project (contact Rusty). If use use one
of the callsign servers derived from his tapes, please send him
a little contribution! Think of it as Shareware.

>there is no sense in sticking it out in a group of its own.

Packet radio is relevant to ham radio in general. For ANY group all
subtopics are relevant in some way. This is an argument for usenet
to limit itself to two levels of hierarchy and large flat newsgroups.

The question might be better posed as: Is it relevant to the majority
of the people who discuss ham radio in general. If r.h-r.legal is going
to have everyone reading it as r.h-r, then there is no need to split.
for those (such as myself) who will read r.h-r.legal, there will be no
reduction in the number of articles to pick through. But I really suspect
that many will not read it.

But there is the issue of whether or not we want all legal issues in the
subgroup or just those that pertain to the FCC.

>If the purpose is to segregate flaming (as opposed to real discussions)
>then (a) the name is wrong, (b) it won't work anyway. The code/nocode
>meatheads are not likely to have the good sense to keep their flaming
>in the rec.ham-radio.useless-flaming newsgroup!

If you segregate flaming for the sake of flaming, of course no one will
flame there. But if the subject has merit, then it will work, I believe.
Part of the reason for flaming in the first place is people who really
have no interest in what they posted in, posting something off the wall
and getting someone else ticked off. I believe that if you make it easier
for some people to NOT read some articles, then the number of flames will
go down. I believe that if we had this group all along, and if no one
posted anything FOR EITHER SIDE anywhere other than r.h-r.legal then many
would not have read the issue at all and would not have posted something
that someone else considered worth flaming on.

I'm still for rec.ham-radio.legal or rec.ham-radio.fcc whichever seems
the more appriate. Most things will fit under both.

I am looking for out of band modification info for the Kenwood TM431A
440MHz transceiver.

* * * * * * * * * * * * * *   DISCLAIMER   * * * * * * * * * * * * * * *

I do not intend to use this radio for commerical purposes. I use Motorola
radios for use on commerical bands.

* *

I plan to use the modification to allow me to fill my additional memory
locations (15) with commerical channels. I can then use the scanning
feature on my Kenwood.

I hope the above disclaimers will deter another round of modification
traffic. We've all been through it before.

Please E-Mail responses.

Wow, I got about 6 replies about K1YVI. One even found him in
a 1963 listing, strangely enough, that's when we were
together.
His name is Arnold J. (Mike) Molloy. We shared a mountian top off
the coast of new Guinea for 6 weeks in the winter of 62, 63
and listened to hams a lot on 20 meters. He was quite a bit older
than I, 30 or 35 then, an Air Force lifer.

I was brousing rec.ham-radio and thought of him, so i
inquired.

Thanks for the replys

Hello Oscar users -----

Just a reminder - CE0ZZZ [Juan Fernandez Is.] is on AO-13 and AO-10 on a downlink of 145.890, until This Sunday. QSL via KL7GRF for satellite contacts only -- No QSL via the bureau.

They are also on the HF bands, but I don't know what freq. Just look for the Pile-up's.

Hope to see you on the Birds --

I would appreciate receiving e-mail discussing the following question. I will post the results if they are of general interest.

I am looking for the ultimate quality in a general coverage
receiving system (i.e. .1Mhz to 200Mhz or better) capable of
receiving all modes in use (AM/FM/USB/LSB/CW/RTTY/FAX/etc.).
I need very good sensitivity and selectivity to
DX distant weak signals. Assume that I will have access to an antenna
farm. I will interface to a PC. The question is:
Do I buy the ICOM R71A (.1Mhz to 30Mhz) and the R7000
(25Mhz to 2000Mhz) cost ~$1600
or do I buy a second hand ICOM R9000 (AUG 89) (.1Mhz to 2000Mhz)
with a CRIS 6000 for $4,200
Obviously there is a difference in price, but the R9000
has also plenty of good stuff (i.e. spectrum analyser)

I anyone using an R9000 ? What is your impression ?
I anyone using an R7000 ? What is your impression ?
I anyone using an R71A ? What is your impression ?

Again, I am looking for very good selectivity and
sensitivity.

May be someone will suggest a different setup
(Yaesu, Kenwood, etc.)
Someone suggested the AOR 3000 scanner but I am ruling
it out because of its poor signal separation and the
lower quality of its SW portion.

Tahnks for the replies

Is there a list maintained anywhere that shows what PBBS address a
particular amateur uses as his main PBBS.

This type of information would be good in the callbook, but I don't recall seeing it there.

I have been compiling a list of calls I see here, that have PBBS addresses associated with them. Has anyone else done a similar thing and have it online somewhere or is interested in such.

Don't forget the moonbouncers, they still need the power for that path unless they use truely monsterous antenna arrays and/or lots of DSP. And when they have the monster arrays and lots of DSP the truly wacko will want to try Mars bounce. :-)

```
Even at HF in the late summer when atmospheric noise is at maximum, extra
power is sometimes needed on 160 and 80 to make the circuit work. Power
is not evil, misuse of power is evil.

It can't be done because it can't be done objectively.  What you're left with
is a clique, a club of good-ol-boys, who are the only ones able to judge who
is the true "keeper of the flame" for the future.  Personalities will get
involved.  Feelings will be hurt and flames fanned.

Do you have something else in mind?  :)

A comment by someone who uses cameras professionally. In broadcast news gathering, we find that the home cameras are too small and light to be used properly. The major thing that differentiates the amateur and the professional TV photographer is the steadiness and smoothness of the professional's pictures. The very small, very light home cameras are nearly impossible to operate steadily and smoothly. Our people prefer a camera that weighs at least 15 pounds and is balanced to be carried on the shoulder. Some of the latest professional cameras are considered to be too light by many of our people and you will see extra batteries taped to their cameras to regain the mass needed for steady work. So beware the tiny cameras, the shaky results may disapoint you. The picture quality is pretty good though.

Who's giving up? It's more a matter of: who has time? I don't find as much time as I'd like even for HF SSB right now. I simply have no need of code. If others want to use it, fine!

Hello to all,

Sometime ago, I received a copy of Joe Kasser's logbook program.
I would like to know, if he's still reachable on USENET ?
Does someone have his adress ?

Hi, Charlie,

It is the *opposite* of what you think -- if it is 100 kHz you are talking about. At that relative size, the equation for an elemental dipole (limiting case of an electric dipole as length approaches zero) will model what you want pretty well. The radiation resistance of the animal is

```
     R = 80.(pi^2).(L/lambda)^2
```

L is length of the dipole element, lambda is wavelength. For the monopole you are asking about, the radiation resistance is half of this. I think a 3m monopole at 3 km wavelength comes to something like 400 microohms, no?

I suspect you are going to have more ohmic resistance than radiation resistance in the an antenna that size even if you silverplate the sucker. Don't expect very high efficiencies.

Now, if you are really looking for physically-small aerials with high radiation resistance, you might want to look at using slot antennas. [I am currently experimenting with annular slots and comparing them with their duals (physically small loops), to see if I can overcome the ohmic loss problems of the physically-small loops.]

73,

Hi folks. I ran into some different broadcast technologies recently that you might find interesting.

1. "Talking Houses"

From American Public Radio's "Marketplace" business show, I heard about a Re-Max real estate dealer in Newton, MA who has set-up low-power commercial AM transmitters in his houses to broadcast taped information to prospective buyers driving by. A sign nearby tells you to "tune to AM 1190" and has a little rack of promotional pamphlets attached to it.

People can turn on their car radio and hear a description of a house, e.g.
"This lovely 2-story Victorian features 6 rooms..." etc., etc.
Apparently the agent has sold all 9 houses where he used the transmitters.

Is this something requiring an FCC license? Who sells such equipment?
Is there a sub-band of AM freqs set up specifically for stuff like this and
for airport information transmitters, etc?

2. Infra-red transmission

On a trip to Minneapolis, we went to a production at the Guthrie Theater.
They had listening devices for rent that amplified signals broadcast in
the infra-red frequencies. All I could get from the person at the booth
was that the listening devices "decoded" the signals from the transmitter.
Can anyone elaborate?

Thanks and 73's.
Bernie, N5PQY

Do you have access to both Usenet and your local VHF packet BBS?

Can you help me with a little experiment?

I need several packet stations who can do a couple of tests for me, which involve listing some bulletins off of their local VHF packet BBS, and then e-mailing the listings to me on Usenet. This is just a short term experiment, and quite easy.

I need folks in several areas across the MIDDLE of the USA, like in Salt Lake City, Denver, Kansas City, St. Louis, and possibly Chicago, Atlanta, Nashville and New Orleans.

I DO NOT need anyone on the West Coast, in Texas, Minnesota, Ohio, Florida or New York/New Jersey.

If you think you can help, contact me and let me tell you what I need.

Thanks!

Bill misconceptions about my antenna system notwithstanding, this was an experiment to see if 6 dB (1 S unit) more power on 10 meters lets you work more stations. The results tend to indicate that more power is not useful from a communications standpoint, and tends to get into your neighbor's appliances 4 times more loudly. :-o

This effectively answered my questions regarding the efficacy of 11 meter linear amplifiers that I've had since my bootleg CB days; it's an expensive way to heat the outside.

Perry / KF0CA

Yes, they do.  It is especially bad in the low bands.  It will mess up you
TV if you have a weak signal.  It also is bad for FM radio and a weak signal.

>>2. Semi-ghetto effect due to lack of contact with hams on the "main" subbands.
>>3. Duplication within these subbands of band planning done elsewhere and resultant planning/ccordination problems.

>This is provably false. Look at the current incentive-induced Novice ghettos, and tell me that you still belive this. Gentlemen's agreements for DX, ATV, packet, et.al. grow from the allocation. That will be the first test - can the NoCoders be Gentlemen ?

Not applicable. The Novices got the entire FM repeater subband on 220 MHz according to the ARRL suggested national band plan (yes, I know some regions expanded it). In big cities, Novices are NOT in a ghetto and Communicators would not be either. The rural areas where EVERYONE is on 2m are another story.

If the subbands are just tiny portions, such as 10%, then there will become a mainstream of the other 90%.

>Well, I'm one of them, and I'm at 20 seconds of solid copy at 18 WPM. I see it as a challenge, and much more real-world than watching TV, playing computer games, working DX, or any of the other Great American TimeSinks.

And to think I once taught a computer to send Morse Code for everything it typed out in the normal course of programming. Oh well.

>It's currently playing on cassette players across the country. Sigh, no blinkenlights or whizzengrafics.

That's unfortunate (the lack of the "blinkenlights or whizzengrafics"). Gotta do something about that.

>Attitude, my friend, it's all in the attitude. It is a game if _you_ define it to be (just like life, but I wax philosophical). The problem is that Morse is an audio training exercise, and any video is a distraction. Pretty low tech, I'm afraid.

Using them blinkenlights.

>Hey, I don't know ! If I did, I'd have some specific suggestions. My off-the-cuff impulse is to make Communicator a sub-band within the Novice subband on >30 MHz. If the subband doesn't exist, create one like that found on HF. I'd suggest an initial allocation of 10-20% of the (sub)band. I think we have enough on 1200 MHz and up to allocate a couple ATV channels.

The Novice subbands are not enough to deal with Communicator. I won't be able (and won't bother to try) to recruit new hams if they get stuck in just the Novice subbands.

It's pretty simple. It's interesting that it is a code that people and computers COULD communicate with each other with (if slow enough, computers CAN do stuff like 1200 WPM).

If by TCP/IP on CW you mean to encode an IP packet into a stream of Morse Code symbols, then you lose the ability for humans to directly deal with it.

I believe there are some CW BBS's on the air. If someone releases a really good Morse decoder program that can handle a wide range of speed variation and "fist", then these things could become more popular.

We are rapidly approaching a level of technology where what is "simple" might instead be to just let a robot whip out an instant chip to do it,

and discrete parts as we know it will be in museums.

****

Don't forget about the Usenet un-net this (and every) Saturday Nov 17,90 1700-1900Z, 28.410 or 28.390 MHz. Basically, call "CQ Usenet".

Pretty bad turnout last week - but I'll be there. And, I'll be taking names of everyone NOT there.... and sending out negative-QSL cards ! So be there... or suffer the consequences....

****

Here's some other stuff...

==> HT Antennas...

There was alot of discussion about antennas for HT - specifically for the ICOM 24AT. Well, my own independent tests show that stock ICOM antenna on the 24AT is about 3 S-units down on recieve over the Larson rubber duck. It similarly does badly on transmit as I was unable to bring up some distant repeaters with the stock antenna compared to the Larson.

My choice for a replacement antenna for the 24AT was the Smiley dual-band tuned whip antenna. The claim for the Smiley is as follows:

2m 1/4 wave (all sections up) 1.2 swr
440 5/8 wave (2 sect. down) 1.2 swr
440 1/4 wave (all sects down) 1.4 sw

The smiley is an 8-section whip thats about 24in when extended and equal in size to the rubber duck when its collasped.

I was unable to thoroughly test the Larson against the Smiley. But the Smiley collapsed gave equal receive signal strength with the Larson. We were unable to thoroughly test transmit performance.

The price of the Larson and Smiley is about the same - $20. I'd go for the Smiley given that its is "configurable" as described above... and, I think that just on theoretical grounds (if that counts) the whip should outperform a rubber duck - if performance is what you need. The Smiley is not at all flexible ... so its logistically more difficult to deal with.

In any case, if you've got a 24AT with the stock antenna... get rid of it. I don't understand why ICOM put such a terrible antenna on such a nice radio. Also, I don't know ICOM doesn't advertise its "extended receive". This would be a buying decision for some people.

==> HF Mobile Antennas

I've just recently started using HF rig in my car (Kenwood TS-440S). I've been using Hustler antennas getting pretty good results. Made a couple of DX contacts today on 10m. Got 5x7 signal reports from Northern Ireland and the U.K. (Newcastle). This was using the special (shortened) RMX 10m Hustler antenna (about 57in long).

I have 2 questions.

1) The instructions that come with the Hustler tell you nothing about these antennas. The RMX antenna is about 57in long. The "standard" Hustler mast with resonator is about 8ft tall.

Are these cut for 1/4 or 1/2 wave, or what ? If its only 1/4 wave it means I need a good ground-plane to make it work. If its 1/2 wave I don't (thats my understanding, at least). The RMX and the "standard" mast are very different in length but they *appear* to use identical resonators. So, I don;t know what to make of this.

2) Mounting. As mentioned I kinda like going mobile with the TS-440. But, as usual the HF antenna is a problem. If there antennas are cut for 1/4 wave then its necessary for these to be mounted over a metal surface for best performance. If they are 1/2 wave they don't need a ground plane and could probably be mounted "anywhere".

I've got a IROC Z-28 Camaro and I don't want to "cut it up" too bad to get a HF mobile antenna on it. Any suggestions?

==> Intense Mag Mount ...

And, I'll just pass this along. If you're looking for a really "intense" mag mount base... go to your local CB store and get a K-40 mag mount base.

These mag mounts are "industrial strength". Mag mounting the RMX 10m HF antenna is NOT recommended by Hustler. But, most Ham mag mounts are wimps. In fact, the Larson PO-MM can't really hold my VHF/UHF Diamond NR-790A.

In fact, the K-40 mag mount is strong enough to hold the Hustler RMX mast & resonator on the roof of my car @ 70 mph without problem. Basically, I use a HLM Hustler mount on the K-40 base. It all works out ok and I, so far, have not had to "cut" my car to add a permanent HF mounting base.

Dear netters (how's that for genderless? :-),

I am in need of any available information for a Yaesu FT-202R Handy Talky. This is an older 2 meter HT which is crystal driven, so rather limited in its use. HOWEVER, these are ideal for Civil Air Patrol usage (which only uses a couple of frequencies) and we have acquired 3 of these radios.....unfortunately, all of them are broken, and we'd like to repair them. I could use schematics, operator's manual,
and any other data which may be available for them, including an address of where we might buy crystals for this radio (one of them does not have the correct crystal
for CAP frequencies).

Please email me if you have any information on these.

In response to the previous post about Communications Quarterly, I called the indicated number. I was very surprised to find that they are just about to go to print.

I had been waiting (being a former HR subscriber, CQ adoptee, and recent ex CQ subscriber) to get the promo in the mail. The gal didn't know why alot of people didn't get the promo literature - somebody probably put a <not> in the wrong place in an awk script.

In any event, I just wanted to emphasize that if you want to get in on Communications Quarterly then you had better call them. NOW. Don't wait for promo info.

The charter subscription provides for an initial cost of $24.95 with the premier issue being free. The regular rate will be $29.95.

Call 1-800-457-7373. Have your credit card ready as I don't know if they'll accept "bill me" subscriptions.

As a distraction to the marine radio discussion, most of the inexpensive
radios have a 10.7MHz IF, probably with low side injection. If you swap
the transmit and receive synthesizer RF the radio should operate on 2
meters. For instance, the calling channel 156.800 would become 146.100.
Anybody ever tried this?

HIGH number????? A 10 ft whip at 100KHZ will be a LOW impeadance  on the order
of 1-5 ohms!!!! A 10ft whip is a SMALL part of the wavelength at 100Khz and
therefore doesnt even get close to double digits!!

I always liked the government/military method of frequency designation. They
assigned frequencies on the basis of the channel center. Hence, for FSK, being
assigned to 7709 khz meant your mark and space tones were space equidistant
```

above and below 7709. Similarly, 4595 khz USB on a 3 khz wide channel called
for placing the suppressed carrier down 1.5 khz or 4593.5 khz.

It's our old friend Part 15, intentional low-power radiation devices.
If you keep the power low enough, the whole AM band is open to this sort
of stuff. A variation is carrier-current, where you feed the power
lines which leak a little to the buildings they feed.

LPB Corp. (in Pennsylvania, someplace, I think, but it's been a while)
makes low-power AM transmitters, mainly for carrier-current, tunnels,
etc. There may be some others too.

Forgive me if this is the incorrect group for my request.............

I just purchased a used Yaesu FRG-7 (circa 1982?). The unit works very well, and I think I have figured out just about all the controls.

However, it didn't come with documentation and I was wondering if any of you folks had a copy of the documentation, and if I could pay for a xerox copy? I am interested in both the user's and the service manuals.

Please e-mail directly to me.

Thank You for your help,

Marshall Lollis

I'd like to tap into the net.wisdom here. It seems that I've just acquired a lengthy commute(merrily we drone along...), and I would like to put an HF station in my car. I already have a suitable radio (Atlas 210X), and my main concern is antennas. The car is a '76 VW bus. The body is fairly ratty, and I have complete freedom as far as drilling holes is concerned. But I have questions about antenna placement. I have a hustler mobile whip and a Webster band-spanner. The bus is shaped like a tall box, so there is no "trunk lid" to bolt the antenna to, like there would be in a sedan. The easiest thing would be a bumper clamp. But then the whole bottom section of the antenna will parallel the side of the bus. I think that the bus will shield off the antenna from that direction of radiation. Not only that, but a good deal of RF has _GOT_ to be capacitively coupled to the body of the bus. Has anyone had experience with such an installation?

If I mount the antenna on _TOP_ of the bus, the whole mess will be way too high for internal parking structures, etc. Heck, it might even ding the bottoms of freeway overpasses. Sure would work well, though. How about mounting the antenna _HORIZONTALLY_ a few feet above the bus roof? Still bad for parking, but freeway overpasses would be okay...

So, does anybody have a solution to mounting HF antennas on busses, vans, etc? Has anybody tried bumper mounts? Do they work as bad as I suspect they might? How about alternate antennas? Maybe a shortened dipole stretched across the roof, with a pole on the rear bumper and another pole on the front? This bored commuter wants to know!

- Jerry Kaidor, KF6VB

The ideal solution would be to mount the antenna on the center
of the roof top. A way around the problem of height would be
to use a shortened antenna with a top hat. But now we get to
the chosen frequency. You didn't mention that.

A shortened whip with top hat for 14 MHz could be made to be
about 3 or 4 feet high and the top hat would have to be about
2 feet in diameter. To get the height scrunched down that
much you would also have to use an inductance between the
vertical section and the tophat. This all results in some
losses but local ham whom I helped design such a beast
runs a KW to it and gets all over the world with it.

Don't know if the height I mentioned would still be too
high, though, when mounted atop a VW bus. My friend runs
it on one of the rails of his pickup.

I saw that ham plate in the earthquake show and looked it up in an
earlier callbook. The guy was in there, in one of the L.A.
suburbs. Not a good move on the producer's part.

Do it like the automotive training competitions. Present the applicant with
a carefully broken radio and score him on how quickly he locates and repairs
the trouble. Deduct points for replacing good components or for damaging
good components in the course of troubleshooting. I have some fiendishly
intermittant parts I'd be happy to surface mount in your HT for the exam.
:-)

I worked him on 28.021 last week. The person is a good CW operator and
copied my peanut whistle (gave me 539 for 40 watts to a vertical just
as the band was closing) at 30 wpm. A very good clean fist.

I seem to recall a piece in QST, perhaps 1985-1986 about a bloke with an R71 RX. He had dismantled the set and had accidentally placed the CPU board ontop of tools on his bench. This had caused the battery backed RAM to be cleared. I believe he said that reprogramming could not be done in the US - it had to be returned to J-land.

I know that I personally have nothing at risk, but some people are going to spontaneously acquire surprisingly expensive component collections.

Some manufacturers, and I dont know which, have got themselves a nice little time-bomb ticking away out there in the field. Short of free replacement sets or a full-price buyback scheme it is now too late for them to do anything about it.

No reviews seem to have covered this matter

this must be the best place to share information as the equipment starts to die. The ARRL and RSGB etc presumably will not risk their advertising revenue.

AMEN Brother, where do I sign up. Just kidding. The DSP'ers workbench
if being put together for two different products at this time. The DSP-X232
by AEA and the TAPR/AMSAT DSP plug in communications board. This will be
libraries, source, programming models, example modems, FFT's for spectra,
and much more with design tools written by me. There is another offering
for amateur radio, this is LL Grace's advertised DSP-12 as seen in several
magazines. CAVEAT EMPTOR. Today is Friday Nov.16 and as of last weekend

(1) The DSP-12 HAS NEVER HAD A MODEM RUN IN IT ON THE AIR
(2) HARDWARE ISSUES ARE <<<_STILL_>>> being worked on and
(3) Contrary to LAW, the unit is being marketed WITHOUT FCC type acceptance.

To the best of my ability to find out, the unit has not been submitted for
FCC type acceptance since it DOES NOT YET WORK. 40 modems is to say the
least, an exaggeration.

Truth-in-advertising: I am the founder/leader of both the TAPR/AMSAT
and AEA projects. The former is joint with W3IWI,WA7GXD. The first
of each units are now in the hands of Alpha/ Beta testers for TAPR/AMSAT
and AEA respectively. AEA will ship more to the ALREADY CHOSEN Beta
testers over the next couple of weeks. The most onerous task of providing
a manual for thing is now joined in earnest. It is FINALLY the time
to get ready for DSP to make a true impact on ham radio.

Charlie,

I think it is a pretty small number too. I don't remember the details
very clearly but maybe someone from NIST can comment on WWVB's (60 KHz)
antenna farm. I seem to remember it being a 200' tower with heavy
duty capactive hat loading. Even combined with a large room basically full
of matching network (I think you can stand up inside the inductor which
is no doubt silver plated) the overall efficiency is under 2 percent or
so. SoI don't think that WWVB actually radiates much more than many amateur
stations on 20M.

Well, about half the frequencies were added at a later time,
when the current equipment state of the art could support
closer channel spacing.

The Marine Band channels US / International:

CH	RX/SPLX	OFFSET	XMIT	ACCESS	BAND	US/INTERNATIONAL	DESCRIPTION
99	156.000				MARINE	00/00	RX only
99	160.650	-4.600	156.050		MARINE	01/01	REPEATER
99	160.700	-4.600	156.100		MARINE	02/02	REPEATER

In response to 3898 swap times. The traders Net is held each Fri. and Mon.
nites at 7:00 p.m. E.S.T. It lasts approx. 2 hours depending on check-ins

There is also an excellent traders net held on Sun. mornings on 3945 beginning at 8:00 a.m. This one runs about an hour again depending on check-ins.

Is such "openness" limited to the AM broadcast band? Or does it apply to the _WHOLE_SPECTRUM_? If it doesn't, how does anybody dare market RF signal generators?

This Christmas, I am going home via Amtrak (from Indiana to New York).

I'm really looking forward to it, actually. I have a sleeper, and have always loved travelling by train.

While I'm aboard, I though it might be a great opportunity to get some unique QSO's (how many xx2xxx/train mobile calls have YOU worked?), but I need some help with an antenna. I'm going to be working 2 Meter, and I was wondering what kind of antenna I should use. I'm going to be on my HT. The last time I tried this trip (going west) I used a magmount that I put on the window casing. I thought I might get better reception if I used a dipole mounted on the glass. Does anyone have any thoughts?

On the same note, I would also be interested in knowing the Amtrak freqs. My 2M HT goes from 136-174, so if there are any SWLers out there, I'd appreciate learning the freqs in use on the train itself, and in the Chigago and New York yards. Actually, I'm hoping that there will be an accident, so that I can use my non-type accecpted gear on their freqs. >:-)

In any case, I gotta go study more and more and more...........

>you are asking about, the radiation resistance is half of this. I think
>a 3m monopole at 3 km wavelength comes to something like 400 microohms,
>no?

I think you are both correct. The original question asked about the feed point impedance, not the radiation resistance. The feed point impedance will be the radiation resistance in series with a very large capacitive reactance. Thus the magnitude of the feed point impedance will be a high number because of the reactive component, even though the real part is small.

```

A small group of us will be heading for Little Cayman Island, B.W.I. next week (Monday) to have some fun in the sun and operate in the CQWW CW Contest (mutually exclusive events).....

```
The group will consist of:    Dave KM3T/1 (ZF2PT)
                              Paul K1XM (ZF2PR)
                              Charlotte KQ1F (ZF2PQ)
                              Tony K1KP (ZF2PS)
                              Michelle (Tony's XYL)
```

We will be active on all bands (160-10m) and I will be active on 50 MHz periodically during the week. I am open to skeds on 6m if anyone so desires. Just send me e-mail this weekend....I'll check e-mail periodically and then once again late Sunday night. Send along date and time for skeds and I'll be there.

Otherwise, please work us both outside and in the contest....we'll be active on both phone and CW before the contest, and possibly some RTTY during the week. Our call in the contest will be ZF2PR....

Please look for us....hope to work many of you from the net....

73

I had recently inquired about a 900 MHZ transmit mod for the IC-24. I recieved a couple of responses, leading me to believe that the mod is not worth doing. It is a hack-and-a-half and not a useful mod.

The replies are summarized below. Thanks to those that responded.

jv <- "Of course the recieve mod is trivial *and* useful"

> you should be able to *receive* 900 mhz, but only a rare 24at can transmit there. Apparently it has to do with the variable quality (on the leading edge) of internal circuit components.
>
> There are then some additional diodes that need to be changed around.
> A friend of mine attempted this with his 24at, but it was unsuccessful.
>
> Walt Spector KK6NR
> (wws@rena.cray.com)

> This mod does not work .... the author of the mod admitted to this in a phone conversation I had with him. What you get from the mod is just a 2nd harmonic of a 450 MHz signal.. and a weak one at that.

I have the same problem. I called Hustler in Texas and got the following info/advice.

1) The Hustler 54in MO-1, MO-2 mounts with resonator are 1/4 wave antennas so they need a good ground plane.

2) The best place to mount them is on the roof. The worst place is on the bumper as there is too much parallel metal. Trunk mount is "ok" but not as good as roof mount.

3) The special RMX has a shorter mast and slighly

longer top whip section. The RMX also has less wind load than the MO
masts + resonator.. which makes them 8 ft tall. Since the guy at
Hustler told me the RMX was 1/4 wave ... and resonators were interchangable
with the MO masts... I tended not to believe the RMX was *really* 1/4
wave. However, if I can talk to Northern Ireland and the U.K. with
the RMX from my car... by experience, I'd say that even though the RMX
is not really a 1/4 wave.. it works just fine.

As regards the "parking structure problem", Hustler has a "fold over" mast
thats only 22in in height when folder over. That might work for you.

The guy at Hustler in Texas also told me that all these mobile antennas
also work well for non-mobile operations. The recommendation was for a
8ft X 8ft layer of "chicken wire" under the Hustler to supply the ground
plane... :-)

Yes, yes! Amateur radio does indeed live in Wyoming! Has a nice QSO yesterday
with KA7HCO in Casper. Now, finally, after 14 months, I've made WAS CW. Now
if I can just get the S.D. station to send me his card......

>This Christmas, I am going home via Amtrak (from Indiana to New York).

I've used my HT succesfully on long bus trips, so let me suggest some pointers.

The most important part of any ham station is the antenna. A rubber duck inside a metal container doesn't work very well.

I purchased a collapsable 1/4 wave antenna and clamped a large suction cup to it (can be found in any decent office supply store). I then attached a 19 inch long counterpoise to the clamp to act as an artificial ground. The whole contracption is then suctioned to the bus window.

This works great! I can hit repeaters many miles away - much better than a rubber duck.

I also use a 5 amp-hour gel-cel I purchased as Dayton. This conserves my nicads and provides the 12 V input that my IC-24AT requires for 5 watts output.

Good luck. Time to get into training so that your plans are not derailed and you're driven loco.

NEWINGTON CT NOVEMBER 16, 1990
TO ALL RADIO AMATEURS

THANKS TO ALLEN SINGER, N2KW, AND THE TRISTATE DX PACKETCLUSTER NETWORK, DR. RICK DORSCH, NE8Z, AND SALIM AL-KITANI, A41JV, FOR THE FOLLOWING DX INFORMATION.

AFGHANISTAN, YA. AN UZBEKI, A FRENCH EMBASSY EMPLOYEE, AND A GROUP OF EAST COAST DXERS ARE ALL PLANNING OPERATIONS FROM KABUL DURING 1991

ALBANIA, ZA. THREE ALBANIAN OFFICIALS WERE ENTERTAINED IN BUDAPEST FOR TEN DAYS, AND OBSERVED AMATEUR RADIO IN ACTION. A JOINT HUNGARIAN-ALBANIAN OPERATION IS BEING DISCUSSED WHICH WOULD ESTABLISH A PERMANENT ZA CLUB STATION. APPARENTLY, THERE ARE SEVERAL SEASONED CW OPERATORS IN THE MILITARY WHO WOULD LIKE TO TRY CONTESTING.

ANGOLA, D2. THE RUMOR MILL HAS DJ6SI TARGETING THIS ELUSIVE DX SPOT.

BANABA, T33. ONLY 5 DAYS LEFT TO WORK T33R OR T33T. THEY HAVE BEEN ACTIVE ON NINE BANDS, OFTEN CALLING CQ WITH NO ANSWERS.

BRUNEI, V85. V85OM BY N2OO WILL GO QRT TOMORROW. TRY 21027 KHZ AT 0000 UTC OR 14027/14165 KHZ AT 1100 UTC. QSL VIA N2OO.

CROZET, FT8W. FT4WC IS EXPECTED TO COMMENCE OPERATIONS THE MIDDLE OF DECEMBER. QSL VIA F6GVH.

EAST MALAYSIA, 9M6. CW OPERATIONS BY 9M6OO NOVEMBER 16 TO 30.
ALSO, 9M6NA NOVEMBER 21 TO 26. POSSIBLE SSB ON 14165 KHZ AT 1100

UTC.

FAROE ISLANDS, OY. OY9JD LOOKS FOR WEST COAST STATIONS ON 28490 KHZ AT 1800 UTC.

JUAN FERNANDEZ, CE0Z. TWO DAYS REMAIN TO QSO CE0ZZZ. ALL TIMES UTC. 7 MHZ AT 1000, 14 MHZ RTTY AT 1100, 14 MHZ SSB AT 1200 AND 0300, 28 MHZ SSB AT 2200, 24 MHZ SSB AT 2300, 21 MHZ SSB AT 0100 AND 14 MHZ CW AT 0200. THEIR SATELLITE SIGNAL HAS BEEN VERY STRONG.

LIBYA, 5A. RUMORS PERSIST OF A 5A0DX OPERATION FROM NOVEMBER 17 TO DECEMBER 8.

MARION ISLAND, ZS8. ZS8MI HAS BEEN ACTIVE ON THE 20 METER LONG PATH AT 1300 UTC. TRY 14226 KHZ OR 14260 KHZ ON SATURDAYS. POINT YOUR ANTENNAS TO THE WEST.

MALYJ-VYSOTSKIJ ISLAND, 4J1. JANUARY PLANS FOR THIS OPERATION HAVE BEEN POSTPONED UNTIL MARCH, 1991. INCLUDED WILL BE 160 METERS, RTTY, AND AROUND THE CLOCK OPERATION.

MEXICO AND SANTA MARGARITA ISLANDS, XE3. DR. RICK DORSCH WILL BE OPERATING FROM VARIOUS AZTEC AND MAYAN INDIAN RUINS IN MEXICO FROM NOVEMBER 30 TO DECEMBER 11. HE WILL ATTEMPT TO OPERATE FROM SANTA MARGARITA ISLANDS, IOTA, NA-78, BETWEEN DECEMBER 6 TO 8. WITH ONLY 25 WATTS, HE WILL USE THE 10 METER IOTA SSB FREQUENCY OF 28460 KHZ OR 28005 KHZ ON CW. LISTEN FOR XE3/NE8Z.   QSL TO K8LJG,
JOHN C. DROLL, 3528 CRAIN DRIVE, FLINT, MI 48506, USA.

OMAN, A43. A43SR/MM WILL BE OPERATING FROM OCTOBER 23 TO MARCH 10, 1991, DURING THE 100 DAYS OF SAILING THE SILK ROADS MARITIME ROUTE FROM VENICE, ITALY TO OSAKA, JAPAN. THE OPERATION ON BOARD THE OMANI YACHT, FLUK AL-SALAMAH, WILL INCLUDE OPERATION ON 80 THROUGH 10 METERS. THANKS TO SALIM AL-KITANI, A41JV, OF ROARS, FOR THE INFORMATION.

PENGUIN ISLAND, ZS1. LOOK FOR ZS9Z/ZS1 STARTING NOVEMBER 27TH. THE SIX DAYS OF OPERATION WILL INCLUDE TWO STATIONS ON NINE BANDS RUNNING CW, SSB AND RTTY.

ROTUMA, 3D2. VK2BCH IS NOW ACTIVE AS 3D2XV. TRY 14222 KHZ AT 0330 UTC.

SAN FELIX, CE0X. XQ0X OPERATION WILL BEGIN NOVEMBER 20. OPERATOR JUAN IS A LOBSTER FISHERMAN, WHO SPEAKS NO ENGLISH. HE WILL VISIT NETS FOR LIST OPERATIONS. WATCH 14242 KHZ OPENING DAY. JUAN DOES NOT OPERATE CW, SO DO NOT ASK FOR CW. HE WILL BE OPERATING ONLY AS HIS WORK SCHEDULE ALLOWS. QSL VIA CE3ESS.

USSR, OBLAST HUNTERS TAKE NOTE. OBLAST 020 HAS BEEN DIVIDED AGAIN, REINSTATING OBLAST 179 EFFECTIVE AUGUST 17, 1990. UL-O REMAINS OBLAST 020, WHILE UL-A IS THE NEW OBLAST 179, MANGISTAUSKAYA.

UZBEK, UI8. UI8ZAA HAS A POTENT SIGNAL ON 20 METER SSB AT 0300 UTC. ALSO, LOOK ON 10 METER SSB AT 1300 UTC. THE OPERATOR SAYS HE IS GOING TO AFGHANISTAN IN 1991. QSL VIA K9FD.

VATICAN, HV. HV3SJ, ON CW, BY N6AR, NOVEMBER 13 TO 18. QSL TO I0DUD.

FOOTNOTES. TP5HA WELCOMES HUNGARY TO THE COUNCIL OF EUROPE, NOVEMBER 16 TO 18 FOR CW AND NOVEMBER 23 TO 25 FOR SSB. QSL VIA F6FSQ.

GW3WQU/4U IS ACTIVE FROM BELUCHISTAN. THIS COUNTS AS AP FOR DXCC.

ARRL HEADQUARTERS AND W1AW WILL BE CLOSED NOVEMBER 22 AND 23RD FOR THE THANKGIVING HOLIDAY. THE NEXT DX BULLETIN WILL BE SENT ON W1AW FRIDAY, (UTC) NOVEMBER 30.

One more item about operating a ham station aboard a train...

My cousin's brother-in-law knows a lawyer who thinks he once read that operating any kind of transmitter aboard a train is against ICC regulations, even if one has the expressed written consent of the train's captain. Any spurious rf transmission could accidently trigger the train's sanitary dumps in the lavatories. The sensitive navigation system could also be affected, causing the train to go off course.

Furthermore, he states that the ham tranceiver may be confiscated during the pre-boarding carry-on luggage inspection.

Any of the myriad wannbe Perry Mason's out there know for sure?

I disagree with all the other posters so far. The impedance will
be HIGH, not low. Sure the radiation resistance is small, but the
capacitive reactance is high.

10' is about .001 wavelengths at 100 kHz, so if I remember correctly,
Z is roughly .0005 - j 20000 ohms. This is theoretical, of course,
and doesn't include loss resistance.

And that reminds me of an interesting story. You will find that most marine radios do *not* have a 10.7 MHz. IF, but actually it's at 16.8 or 16.9 MHz. This is because the very strong coastal telephone stations happen to be offset just about exactly 5.35 MHz (to allow full duplex operation), and this half-IF frequency causes intermods that are *very* difficult to get rid of. The pioneers in VHF Marine Radio, such as Konigsberg Electronics (Konel), learned this the hard way. The chief engineer there (Mr. Al Bennett) decided to move to a higher IF and consulted the crystal filter vendors about this.
They said anything below about 17 MHz. was just as easy as 10.7, but above that, the cost went up. So he picked 16.9. The rest of the industry followed, sometimes after rediscovering the hard way why 10.7 was not used. Motorola uses 16.8 MHz. for some unknown reason (maybe just to be different).

We have an ATV repeater here (Davenport, Iowa) where one channel is a direct weather radar feed from the National Weather Service, courtesy of the TV station where the repeater is located. Works very well and is used a great deal by the weather spotters and county EOC.

It only matters as a convention for meeting a station on a specific
frequency. If you agree to meet a station on 14.103 and he's using
LSB and you use USB the two of you will be transmitting about 3khz
apart and will not link up. If you understand this problem and adjust
your frequency to allow for it all is well. But if both of you understand
the problem, and both of you compensate for it, you're back to being
3khz apart again. Specifying a convention helps prevent this confusion.

I wish there was some way the Mac-based ham community could truly reward
Diana for these stacks. I used her earlier sets to go from nothing to Extra
in just over a year. Of course, I read the books, but the ability to have
hypercard test me over and over again helped me realize where I needed more
studying (and helped me with the famous exam nerves syndrome.)

So, Diana, for all of us: Thanks so much!!!

Ah, here's the rub, if you want to use the HF CW spectrum you gotta know Morse. It doesn't matter whether you were required to pass a test or not, if you don't really know Morse you can't use Morse. If you don't want to use CW, it doesn't matter whether you passed a test on Morse or not. Of course to get a license you must pass a Morse test, but that's irrelevant to actually operating Morse. You know even a dyslexic, tone deaf person like me passed a 13wpm test after months of generally wasted effort, but I still don't do Morse well enough to enjoy operating HF CW. This certainly makes the Morse exam seem irrelevent to me.

Howdy all!

This year on November 29, The Texas A&M Amateur Radio Club will be running
a special events station. We call it CQ Bonfire.
We will be operating mostly on 10 and 15 meters under the club call
W5AC from about 11am cst to 6pm cst. Contacts locally may be made on
the 146.82 repeater pl 88.5 or dtmf 21.
These are the most likely bands for operation but we will be happy to sked
on any of the following other bands.
80m
40m
20m
15m
10m
6m
2m
70cm
See you there

As I was going through the TV channels the other night, I came across the
scene. It was an interesting camera angle and shot paused there for a moment
with the plate in clear view.

The plate is listed to:

Frank Lewis KE6HK
Westwood, CA

He's probably part of the crew...

The stacks will be in the /pub/ham-radio directory. I'm not doing the
posting, so I'm not sure exactly when the new ones will be there, but
it should be soon.

I believe that several other FTP sites and BBSs carry the stacks, also.
Perhaps people from those sites could post the details.

Patty

Try KE6HK. I'm certain that the call began with "K", and reasonably sure
of the suffix. I think that NE6HK would not currently be a valid call.

In the upstate of SC, they are starting to install an ATV radar link for
the county EOC offices (whose communications are usually handled thru
hams who are members of the CD/EP organization). According to the
plans, it will be kept controlled, with a 2m control link being used (a
DTMF key sequence required to activate the ATV transmission)... I don't
think they are planning to give access to weather spotter groups, but
with the strong support spotters have received from the local NWS WO,
I wouldn't be surprised it that was changed after an initial period.

I've noticed that many new hams (and non-hams) seem fixated on the issue of license class. I realize the following must be obvious, but let me say it anyhow: "There is no correlation between a person's license class and their mastery of the radio arts."

Evidently, a number of people consider the matter of license class to be an esteem issue as well. I consider this an unrealistic way of looking at things.

When the Amateur Extra class first came out, a few people ran out and took the test as a geewhiz kind of thing. Then the "higher class license -> more spectrum" thing came along and a bunch of people upgraded because of the "incentive." It wasn't really a matter of oneupsmanship.

I got my license after the current scheme was pretty well established and I upgraded for pretty much this same reason. I was getting frustrated by my lack of access to certain parts of the spectrum (7.000-7.025 and 3.500-3.525 in my particular case), so I changed that by going to Houston and taking a test. It wasn't a showoff type thing -- it was a matter of doing something for myself to get more out of the pursuit (and life in general, I suppose).

If I had become a VHF/UHF nut from the start, I might have never made it past Technician Class, because I could do everything I needed to do and becuase I percieve the geewhiz value of upgrading as very small (compared to the geewhiz value of wireless communication).

Then the Volunteer Examiner program came along (making amateur radio more accessable, which is probably a very good thing). I would guess this provided the impetus for most of the local non-hf people to upgrade to Extra. Holding any lesser class license would hinder these people from being completely effective as VEs. Once again, it wasn't a "ha ha

-- I'm smarter than you" exercise.

A lot of these people still don't know much about hf, or DSP, or packet or whatever. If judgements of individuals must be made, they should be made on the capabilities of the individuals, not on license class held.

I would like to see people get a little less emotional (defensive?) about a particular class of license someone holds. There has been a lot of emotional talk in this group about restructuring the current system and the future of ham radio and so forth. Go ahead and get emotional about these issues. These are *not* the issues I am talking about. I am specifically addressing the mistaken notion that there is a meaningful relationship between the license class someone holds and the amount of skill or knowledge he or she has.

I'm afraid that the FCC doesn't agree with you. I can't comment on the specifics. But I would generally encourage people to call their local FCC field office, as it does make a difference in these sorts of matters.

> and probably the only worthwhile and constructive use
> currently being made of the amateur frequency allocations.

Clearly not true. Although nearly every faction in ham radio thinks that their little niche is the most important, it is the collective that keeps the spectrum open.

> I hate to burst your bubble, but I stopped keeping records
> when the "roll call" reached 1000. That's 1000 different

Not suprising, since ARF is austensibly a broadcast operation. Your claimed figures clearly bely your motives. By your own admission, ARF is 90% broadcasting and 10% ham radio.

You really should look into getting a broadcasting license. If nothing else, you can run all the power you like. If the audience is as big and as devoted as you claim, you should have little problem raising the money for the license and the type-accepted transmitter.

MENSA   - Minnesota (1129142)

As I've been reading this (yet another) CW discussion I've been getting this idea.....

Isn't CW one of the simplest digital modes? What better introduction to learning communications theory and basic digital communications is there. Especially since it's one mode that can actually be run using the in-born bio-computer.

I suggest that the Amateur galaxy could be enhanced in two directions.

1.) Consider CW as a digital mode. It should be taught in comparison with some of the other simpler modulation methods. Let's start showing how the bandwidths compare and B.E.R.'s and S/N power requirements.

2.) While CW can be run by a human - there's no reason it has to be. How fast can a couple PC's communicate using CW on the HF bands? Are there optimizations to the spacings that improve the performance. What if CW was sent in packets - complete with ACKs or NAKs? Are there any BBS's on the air using CW? How about putting Phil's TCP/IP on CW? You can't ask for a simpler computer-to-radio interface.

An Amateur Packet Radio Overview

by

Rich Bono (NM1D)

October, 1990
(revision 1.2)

The following is the result of a non-amateur asking some basic questions about amateur packet radio. Several of us thought that this information would be useful to others who are interested in amateur packet operations. Thanks to Tim Dayger for asking the right questions, and to Patty Winter (N6BIS) for her editing skills. I hope that this will be of help to many others. You may reproduce and distribute this as long as my credits remain.

Rich Bono (NM1D)

Our potential amateur packet radio operator asks:
I've used networks, on-line services, and bulletin board systems (BBS) for years, but I've never really paid much attention to amateur packet radio. I'm starting from scratch, and need to have some idea of where to begin.

Just what IS amateur packet radio?

Amateur packet radio is (yet another) digital transmission method available for use via amateur radio. It provides 'error free' transmission and reception of messages (information/data/etc.) between two stations. This error-free capability is a prime consideration. Error free in this context does not mean that your typing or spelling mistakes will be fixed, but that all transmitted 'data' will be received 100% intact, as sent. In fact, if the data cannot be delivered 100% intact, the transmission is eventually aborted and the user is informed that there is no longer a connection between the two stations.

The 'packet' in 'packet radio' comes from the method of transmitting your information over the air. Your data is broken up into packets (or blocks) that are transmitted. Each packet contains the sending and the receiving station call-signs and some optional routing information. A packet can contain from 0 to 256 data (or information) bytes. The users normally do not need to be concerned with this 'packetizing' of their messages. Each packet is sent and then acknowledged by the receiver when received. If a packet is not received correctly, then it is automatically re-transmitted (up to a maximum number of times). You normally don't have to know about all this to use packet radio. The 'packetizing' happens automatically, without any thought or actions required by you.

One of the more popular protocols used for amateur packet radio is known as AX.25. This is somewhat similar to the commercial X.25 standard. There is also a growing TCP/IP user base. If you are not network oriented, then the details of these protocols are not important to you as an operator of a packet radio station.

Be aware that most packet radio operation at this time is at 1200 baud. This will seem slow when compared to what it happening on networks, and on telephone BBSs.... but what is gained is world-wide access, for NO COST. Once you have your equipment, and your license, there are no fees (except for the electricity that your computer and other equipment use). There are a growing number of amateurs who are experimenting with 2400 and even 9600 (or higher) baud operation, so it shouldn't be too long before these faster rates become very popular!

What kind of equipment do I need, and how do I use it with my PC?

Since you own a PC, you already own the most expensive part of an amateur packet radio station. The other piece of equipment that you need is the TNC (terminal node controller). The TNC contains all the software and special hardware that you need. It actually contains the modem (to interface with your radio) and (usually) a microprocessor with the packet software contained in EPROM. You interface your PC (or even a simple dumb ASCII terminal) with the TNC via serial RS-232. Use your favorite terminal emulation software on your PC (the same software that you use with your telephone modem will probably work fine). This is just as easy as connecting your computer to a modem. If you don't want to use the serial port of your computer, there are TNCs available that will plug directly into the bus.

If you don't have a PC (personal computer), then almost any RS-232 ASCII terminal will work with most of todays TNCs.

The most popular packet frequencies in the USA are in the two-meter band (144-148 MHz). Check out the following frequencies (they may be different in your area; ask a local amateur if you don't hear anything). Even the typical 'police scanner' can be used to listen to these frequencies:

145.01, 145.03, 145.05, 145.07, 145.09 MHz

If the above are busy, many areas also use:
144.91, 144.93, 144.95, 144.97, 144.99 MHz

Yes, this is with an average FM transceiver set for SIMPLEX operation (transmitting and receiving on the same frequency).

If there are packet radio transmissions you should hear a sound like:

BBBBbbbbbrrrrraaaaaaapppppp

How much technical or hardware proficiency is required to use a packet radio system?

If you can plug an RS-232 cable into a modem, and wire the TNC to your radio, then you have all the ability that you need. I am sure that there are hams in your area who would be glad to help you if you are not comfortable with wiring a microphone connector. Most TNCs connect to the microphone plug of an FM transceiver, normally only needing push-to-talk and transmit audio connections, and a connection to the speaker audio output from the FM receiver. This consists of about five wires, and can usually be done without removing the covers of the radio (these are normally external connections).

Installation really is very simple, and once it is done, there is virtually no maintenance. Just plug in your TNC in place of your microphone and external speaker, and you're on the air... to return to voice operation, plug in your microphone. If you like, build a simple switch box to allow easy changing between your TNC and voice operation. I don't recommend it, but some people wire the TNC and microphone in parallel, so that they don't need to change the plugs, or switch anything at all.

What's out there for me to access via packet radio and what potential is there for growth?

This is the interesting part! I believe that packet radio is still in its infancy. It seems like every day a new application for packet radio is announced... some are good ideas... others not. By the time you read this, a lot of the information presented here will probably be out of date; yes this technology is progressing!!!

Here is a *simple* list that barely highlights some of the available uses of amateur packet radio.. I am SURE that I have forgotten something and left it off the list:

EMAIL:

At this time we have world-wide email (electronic mail) distribution. I personally have received email from a few continents, and from all over the USA. Of course, this is limited by the amateur radio rules and regulations, so there cannot be any commercial messages.

Local networks:

Here in New England we have connectivity over most of the region. I can connect to other stations from the following areas consistently: Canada (Montreal), Vermont, New Hampshire, Maine, Connecticut, Massachusetts, Rhode Island and New York. I should note that I am located about 10 miles north of the MA/NH border (in Derry, NH).

Of course, on the HF (high frequency) bands there can be world-wide connectivity, depending on many factors.

PacketCluster-DX spotting:

This is a specialized system that allows a couple of hundred users to be connected to the same system at one time. It is used by those amateur operators who seek contacts with rare stations throughout the world. When any one user 'finds' a rare station on the air, he simply types the information (call-sign, frequency and mode) into his terminal, and within a minute or so, all of the other users are informed of the rare station!!! So-called "DXers" (people who like to hunt these rare stations) LOVE this system. These users can be spread over a wide area. Our local packet cluster system has connectees from Maine to New York.

DOSGATE:

A system that allows you to execute programs remotely. A DOSGATE system may have many programs for you to use over the air. You don't need to download the programs to use them; you are actually running programs remotely. DOSGATE allows those who don't have a computer to run programs via packet radio.

For example, my DOSGATE system has the following programs available for use by remote packet users:

AUTOEXAM: Take sample amateur exams from Novice to Extra. You can use AUTOEXAM as a study guide, or to see if you are ready for a certain license exam.

SeeSats: Real time satellite tracking. Informs you of where the current OSCAR (and other) satellites are located.

AUTOCALL: On-line amateur radio USA call-sign lookup database. Simply enter the call-sign of any amateur radio operator in the USA and it will print out the name, address, license class and previous call-sign (if any).

GAMES: Several adventure-style games that can be played on-line.

Repeater database: A database of many of the repeaters in the area.

Gateways:

Even though you may not own any HF or UHF equipment (many packet radio operators only use a simple hand-held VHF transceiver), you can gain access to other bands and operating modes by using a gateway. A gateway allows connectivity between two normally non-connectable communication technologies.

In many areas not only are there major BBSs on the standard two-meter Technician class frequencies and the 222 MHz Novice class sub-band, but there are cross-band gateways available as well. A Novice on the 222 MHz band can connect to a station on the 145 MHz band by going through a gateway and be able to communicate with many other amateurs.

Public Service:

Many packet stations are used to help out with sending messages during disasters. Amateur radio operators help out whenever they can, and many hams have their packet stations ready for portable operation to help when needed. There are many training exercises during each year to help practice and test the readiness of the emergency stations.

OSCAR Satellites:

OSCAR stands for Orbital Satellites Carrying Amateur Radio. We have our OWN satellites in orbit that are dedicated for amateur radio use. There are some satellites that are dedicated to packet radio (sometimes called "PACSATS"). These are for 'store-and-forward' operations to help distribute packet traffic around the world.

Bulletin boards:

These carry postings similar to the stuff on Usenet (or telephone BBSs) and often have archives of useful files (such as local ham license testing sites). These are usually the same packet nodes that transport email.

File transfers:

Better at 56 Kbaud (as some hams are doing), but feasible at 1200 baud. On TCP/IP, you just start it and forget it, so you can do it overnight or at some other time when you don't care whether it takes a while.

Databases:

In some areas there are HAZMAT (hazardous materials), call-sign, and repeater databases accessible via the network.

Station-Station:

I almost forgot.. many people simply enjoy chatting with their neighbors.... This could be with people across the street... or in the next state... or half-way around the world!

I am sure that I have missed something. You asked about potential... as I mentioned at the beginning, we are just getting started!!! Many people are just finding out about packet radio. I believe that the only limitation is our imagination!! We could have a world-wide network (we do currently have a 'slow-speed' world-wide network) in the near future... It just takes a little imagination...

How much will a packet radio set-up cost me? How COST EFFECTIVE is packet radio?

Well, if you own the PC already... TNCs can be purchased from about $120.00 on up. There are a few for less money, and several that provide for operating on many digital modes in addition to packet radio (i.e., the Kantronix KAM will provide for packet (HF:300 baud/VHF:1200 baud), AMTOR, RTTY, ASCII, NAVTEX, WEFAX, CW (Morse code),...).

If you already own an amateur FM transceiver (or an HF SSB transceiver) then you have all the equipment needed. If not, a two-meter FM transceiver can be purchased for used from $100-250.00, new from $300.00 on up.

Cost effective.... Hmmm, well first be aware that amateur radio cannot be used for any commercial or business purposes... But where else can one get hours (years) of enjoyment and service out of $470.00 ($350 for a radio and $120 for a TNC, assuming you already have the computer or terminal). Note: This stuff can be contagious.... be forewarned!!

What legal issues do I need to consider regarding packet radio? Do I need a license?

Yes, you need a valid amateur radio license. There is (in the southern New Hampshire area) packet radio activity on the Novice bands. But if you want access to the mainstream of packet radio, you will want at least a Technician amateur radio license. (Although, as mentioned earlier, some areas have an active packet radio network that is accessible with the Novice amateur radio license.)

I've tried reading about amateur packet radio, but a lot of it is Greek to me. Please suggest some reading materials such as books and magazines that my campus or local libraries might carry.

There are a few books, etc... but I have found that most assume that you already know about amateur radio. You need to find what we call (ready for another term?) an "Elmer". An "Elmer" is a friendly, helping amateur radio operator who will take you under his/her wing to help and guide you as much as you need. I hope that you can find someone to help you... it takes a special kind of person to be an 'Elmer' (gosh I hate that term).

Good luck with your packet radio activities. If you find this information helpful, I would be glad to hear from you.... How? Simply send me a message via the amateur packet network, NM1D@WB1DSW.NH.USA.NA from anywhere in the world!

>DSP in a nutshell? No, not even. But maybe I've whetted your curiosity?
>Check out the library! Even the Handbook has some info on DSP.

A good book on the math behind what Brian has described is "Signals and Systems", by Oppenheim and Willsky. Prentice Hall. If you really want your mind bent "Digital Signal Processing", by Oppenheim and Schafer, Prentice Hall, has been the basic text for the past decade. There are newer texts out today and they are coming out faster now that the field is heating up. Be prepared for some heavy math-o-matiks if you get into the theory but as hardware comes on line cookbook solutions for the Amateur will become more available.

I was able to subscribe to Communications Quarterly by calling the CQ (ex-Ham Radio) Bookstore in New Hampshire. I was ordering some books and the clerk mentioned the magazine. For some reason, the price was unclear to both of us, so don't ask me.

Call (800) 457-7373. They answered the phone "CQ North".

>>I think I have the perfect solution.
>>
>>Access to the CW part of the spectrum should be permitted only to
>>those who know the Morse code.

>The CW part of the spectrum is also commonly used for other modes, such
>as RTTY, HF packet, FAX,... Fragmenting the spectrum for a CW-only
>band (where no other modes are allowed) would be a waste of a shared
>resource.

Except for the two CW ONLY subbands on 50.0-50.1 and 144.0-144.1.

>>Access to other parts of the spectrum should be permitted only to those
>>who have the appropriate skills. E.g., only people who can speak
>>should be allowed to use phone, only people with functioning EME
>>equipment should be allowed to bounce off the moon, etc,

Only people who have Morse encoding and decoding equipment should be
allowed to use Morse code (biotechnology permitted).

>Is this a variation of "if you can buy the equipment, you can use the
>resource" ? That idea sounds like elitism, although it does somewhat
>reflect the current reality.

Unfortunately it is reality. But one CAN buy or build equipment to do
all the Morse Code operating if they want.

>"Appropriate skills" sounds like a variation for multiple operating test
>elements to replace the code element. That would drive the VECs buggy,
>and/or make it difficult for a prospective ham to find a VEC that could
>test him on his favorite mode.

It would also increase the paperwork load on the FCC, and push license
processing into the 12-18 month category.

>>It's silly to require people to learn the Morse code in order to just
>>be allowed to talk.

>Tell it to the WARC - they're the ones that require Morse of HF users.

Hey, there is one coming up soon.

That only means you once knew it. It says nothing for certain about the
present.

>If you hold a X class license - it should be fair to assume that (at one time)
>you knew the code well enough to pass the test to acquire that license. The
>only alternative is that you cheated.

Yes, at one time.

>I know of some cases where folks holding a "conditional" class license were
>required to show up for re-examination. This license was the same as the
>current general class - only it was given by a single volunteer examiner.
>Needless to say, folks cheated. (i.e. Bring over a bottle of booze and we'll
>take your test.)

These are no longer issued.

>Back in the early 70's it was a renewal requirement that you sign a statement
>saying you had spent some trivial amount of time operating and that you
>still knew the code.

They were wise to remove that requirement. Continuing to know code is no
more relevant to voice and packet modes than is learning it once is.

One does not need to actually know Morse Code to work Morse Code. You just
need the appropriate encoding and decoding equipment in such a case. That's
not to say manual Morse Code is not enjoyable, its just that there really
are other ways to do it.

Someday I'd like to get involved in DSP processing for EME contacts using
Morse Code and packet.

Anyone who has access to the UK edition of 'Personal Computer World'
for December 1990 should take a look at the introduction to DSP article
(page 218).
It is part 1 of a 2-parter, and gives a good description of the evolution of
DSP, architecture etc.

I've used the US standard white PVC for winding coils & never had any
indication of RF burning or melting it. This was the core of a 40-80 dipole.
As a matter of fact, the PVC even held up when the antenna took a lightning hit
at Field Day!

PVC is also used as the body of several antenna, as well as casings for some
radar units.
I doubt if you will find much absorbtion of RF by the white PVC.

BTW, when you get the antenna working, would you mind posting the design on the
net? A PVC housed gain antenna could be very useful, especially in
apartment/condo installations. I can imagine alot of cases where you could get
away with installing a PVC "drain pipe" or "electrical conduit" in no antenna

subdivisions. As a matter of fact, something like that may work in the place that I'm about to move into.

The following is a portion of the order from the second order from the

UNITED STATES DISTRICT COURT
NORTHERN DISTRICT OF OHIO
EASTERN DIVISION

WHICH WAS FILED NOV-13-90 / JUDGE FRANK J. BATTISTI

START OF QUOTE:

Defendants make the alarming allegation that the new review " is consistant with and is not a material alteration of previous consideration of PRB-1 by ROCKY RIVER." This statement is followed by a citations to the transcript of the prior review which indicates that PRB-1 and technical data were submitted for consideration. The defendants ought not to think that they will comply with this courts order by going through the motions of denying Mr. MacMillan another permit. Any decision to disregard the federal interests raised in PRB-1 must be based upon substantial justification and explained in the record. Defendants should keep in mind that after this litigation that it may be more difficult to support a claim for qualified immunity if they once again fail to sufficiently consider the federal interests involved.

Plaintiff's motion for section 1988 attorney's fees is GRANTED.

END OF QUOTE: THIS ORDER CONSISTED OF SEVEN PAGES. WILL BE POSTED HERE SOON.

DE WA8ZHN / JIM (216) 333-2235 - QTH

-
-Mojo AA4KB

Well I certainly don't intend for it to become a clique. I didn't intend for it to be given by hams (although I fully support the VE program!). I'd like to see either the FCC or ARRL sponsor quarterly tests instead of VE's. I guess what I'd like to see is something similar to the work (but not the $$$) needed to get a pilot's license. You must show conclusively that you understand all of the principles involved, and you must also demontrate that knowledge. They also publish their question pool (I strongly disagree with this practice), but in addition to their written test, they also must show their prowess as pilots. It's extremely hard to get a pilot's license without actually understanding and being able to apply the material, but memorizing the answers to a question pool for the extra exam is easy without having in-depth knowledge. I agree, though, that if it can't be objective, it shouldn't be done. Thank you for your comments.

Well, make that 200 watts for HF and non-moonbounce. But if you're going to
make an exception for EME, why stop at ONE KW? Why not 20? One wonders what
ingenious work with antennas, DSP, etc., would have been tried and perfected if
the KW was not available. Mars? Hmmm, lessee what's the pathloss for that...

-In article <1133@tsdiag.ccur.com> davet@tsdiag.ccur.com (Dave Tiller N2KAU)
writes:
->I've only been a licensed ham for about one year now, but I've been interested
->in the hobby and have listened in for about 10 years. After hearing some of
->the absolutely moronic and obnoxious things done by extras (not to mention
->watching one blow out the finals of a radio 'cause "He was an extra and knows
->how to tune a radio") I'd have to agree with you.
-
-I've noticed that many new hams (and non-hams) seem fixated on the issue

-of license class. I realize the following must be obvious, but let me
-say it anyhow: "There is no correlation between a person's license class and
-their mastery of the radio arts."

In this, Trey, you are absolutely right. That is why I'd like to see a way to prove one's "mastery of the radio arts" instead of one's ability to memorize question pools and decipher beep-beeps. I see many extra class operators around here who have a very (very!) holier than thou attitude, and claim that they can't be wrong 'cause they're extras. I may be a lowly tech, but when I can point to a reference in several books that show the extras ideas to be faulty and they still stick to 'well obviously the book is wrong," or, "why that doesn't apply to this situation," it bugs me. I would like to see a test that would truly separate the people who actually understand radio and those whose egos think they understand radio.
Thanks for your comments.

If you really are serious about that antenna farm, you won't be using low gain-wide band antennas. May I suggest that you treat each of your VHF yagis to its own personal band-specific converter. Switch the converter outputs and your HF antennas into into a good quality HF receiver. You can add antennas and converters as you want to extend your coverage. HF gear tends to have much more serious performance (eg. intermod) and facilities (eg. filters) than is usually to be found in VHF gear. The top VHF contesters and moonbounce people still use transverters and HF rigs for these reasons. You probably may want to use band-specific, switched pre-amps mounted at the antenna.

suppliers:
try MuTek , Microwave modules, Datong etc for amplifiers and converters

The JRC NRD525 and ICOM R71 are generally thought of as about the best nippon offerings. There were doubts expressed in QST some time ago about the R71 losing its internal software when its lithium battery runs down. if you want to go the whole hog, some very good professional receivers (eg RACAL RA1771/RA1772) are appearing on the surplus market.

If you want fancy memory and scanning facilities, dont compromise your choice of receiver, use a seperate computer as a controller.

Dont be seduced by toy spectrum analysers, a real one would cost more than your entire installation. Much of their cost lies in their need for excellent screening and filters. Opening up the width of roofing filters to permit a usefilly wide spectrum display compromises a receivers signal rejection. Lots of whizzo microprocessors and speeping oscillators can mask small signals with their RFI. Real screening costs big money.

Apologies for a long posting, but I got the impression that you were more interested in hearing things than in hypnotising visitors with flashing lights.
All my own opinions, of course........

have fun   GM4ZNX

Howdy netland,

A friend of mine purchased (for $25) a Globe Scout Model 65A transmitter and assorted other bits and pieces of radios. The only documentation he has is a schematic and a tattered copy of an article in the December 1954 issue of Radio and Television News.

Does anyone out there have any info on this rig? Where could I find a reprint of the magazine article?

Bob, N5GNA

Does anybody out there know of any program, running on the PC, that implements the AX.25 protocols? Such a program would possibly interface to a little board plugged into the PC bus with a modem on it. Or is the AX.25 protocol too fast and complicated for a mere '286 to deal with? Maybe there's something in one of the ham magazines? I'd appreciate any leads. The complicated part here would be the software, and even though I'm a systems programmer by trade, I really don't have the time to reinvent the wheel... Have any of the ham magazines ever published sample source code for a TNC?

I've been reading the traffic about PVC enclosed antennas... and everyone seems to be discussing RF absorbtion by the PVC.. isn't there also a velocity factor of the PVC to be considered? I've built several "twin-lead j-poles" and tuned them up outside the 3/4" PVC pipe... when they are slid inside the pipe, they completely detune. There is a definite shortening affect (ie, make the antenna shorter) when putting it inside PVC...

A while back I asked the net for the velocity factor of schedule-40 PVC (the white, plumbing stuff) so that you could anticipate the shortening affect... but I wasn't able to come up with a number...

>--
>

How about an SWR BRIDGE? I built one loosely based on one in the "Radio Handbook", by Bill Orr W6SAI, pg 30.34. It's simplicity in itself. For greatest accuracy use 1% resistors, or hand match them. keep the lead lengths as short as possible, build it in a small metal box, and shield the detected output from the rf. For a detector diode, be sure and use a low-C switching diode, Germanium or Schottky is best, if you can get one.

Of course a bridge like this can't handle much power, but if you're going to be tweaking an antenna with power applied, you don't want to be standing in a strong rf field. I have used this sort of bridge quite successfully at 440 MHz.

OK, OK, I'll fake a schematic:

```
           R.F. input >---o---------o
                          |         |
                          R1        R2
                          |         |
           Reference  >---o---R3----o----<To antenna
           Load (50ohms)  |         |
                          C1        C2
                          |         |
                          o---CR1---o  (orientation of CR1 affects polarity
                          |         |   of D.C. output)
                          R4        R5
                          |         |
                         GND        o---C3---<To Voltmeter
                                    |
                                    R6
                                    |
                                   GND
```

R1, R2: 47 to 51 ohms, non-inductive, match as close as possible.
R3:   51 ohms
R4,R5: 10k
R6:   100k
C1,C2: 1000pF ceramic
C3   1000pF feedthrough
CR1:   switching diode. (i.e. 1N34, 1N82, 1N914, etc.)
Reference Load: As close to 50.0 ohms of pure resistance as you can get.

You can calibrate this with some known resistors on the antenna connector.

>Do you have something else in mind? :)

I believe I posted a thread on this subject where I argued that the ARRL should step in and put more resources of its publishing empire towards more agressive home study in electronics and communications.

The basic license is almost a RIGHT, if it's not handed out objectively, those left out will probably scream bloody murder in federal court.

One need only witness the ongoing waiver question for handicapped applicants (which I have no problem with, but in a less VAGUELY WORDED form) to see the kind of legal force someone shut out of ham radio can muster.

A best case scenario is where a ham takes the basic memorizable, but objective, test to get the Form 610, and then takes home-study courses for honorary accredidation in additional technical subjects. These additional endorsements would be like awards or code proficiency certificates, they would carry no legal authority or give more operating privileges. However, like awards, they would be a source of pride for Joe Ham and would upgrade the technical proficiency of the ham community at large.

One only has to look at the widespread interest in and energy expended at the WAS, DXCC, and code proficiency awards to see that something like this would be in great demand, and would not step into an arena that should best be left to the federal government.

I know KE3Z from the ARRL reads this newsgroup, perhaps he would like to comment......

>(A1-Op ... how's this?)

sure, as long as noone is denied privileges for not having it.

Can someone give me a rough estimate of the feedpoint impedance
of a 10' vertical whip antenna (over ground plane) at 100 KHz? It should
be a fairly high number. If someone has Mininec perhaps they
could give me an answer.

Thanks in advance,

The recent discussions of RF interference sources like the infamous "touch"
lamps prompts this query:

I've always assumed that those "plasma display" toys -- the ones Radio
Shack sells as "Lightning Fury" and "Illuma-Storm Light Display", and
other places sell under similar names, were *terrible* sources of RFI --
that they would act like Tesla coils and generate vast amounts of
wideband hash across the spectrum. But I must admit that this has been
just an assumption on my part, based mostly on the fact that a Tesla-coil
sort of device I have that is used for testing glass for leaks and

demonstrating corona discharge does produce such interference. So I am asking -- do these glass-globed electrical-discharge displays actually produce major RFI, or are they actually less offensive than I had thought?

There is a service called the White Pages server that does this. You send a message with a list of calls, and it automatically sends back their packet addresses.

For example, to find out the packet address for K7SS and KT7H, use this format:

```
SP WP @ AD8I.OH.USA.NA
QUERY
K7SS QTH?
KT7H QTH?
/EX
```

Make sure that you do this only from the BBS where you normally receive mail, as it looks at your origin on the header to generate the reply. This list is maintained automatically. It gets it's data from messages that are automatically generated each time you check into a packet BBS for the first time, and it queries your home BBS.

When I put on the Digital Suite for rec.ham-radio at Dayton this year, I entered the calls on the sign-in sheet into messages formatted like this. I got a bunch of packet addresses back, which I used to send packet thank-you notes to the attendees!

I think that the PVC drain pipe available in the US is similar to that in the UK and is actually referred to as UPVC - meaning unplasticised PVC.

In the best tradition of jargon generation unplasticised does not mean that plasticiser has been removed, but that none was ever added in the first place !

This is reckoned to increase the PVC's resistance to UV

Quite a large number of local homes have been fitted with UPVC window frames, which have to meet UK regs for life expectancy and environmental exposure. Although we are justly famous for our minimal UV levels, these people are gambling around $15000. Perhaps an antenna sleeve in a sunnier clime is a comparable risk :-)

The better quality 1/2 inch co-ax cable (UR67) has a non-plasticised outer and is reckoned to have longer life out doors. It is noticably les flexible than the inferior stuff. Opaque black pigmentation is used to decrease sunlight penetration thus also increasing life expectancy.

carbon has sometimes been used as the pigment- should make a nice RF screen ....

CEO summary:
Kudos to Richard Crisp for reprinting this most interesting and
informative article. Just thought I should give him some positive
feedback before he's inundated with flames for wasting net bandwidth
;-)
Good job, Richard...

Just have her pick up a VHS camcorder and then an 8mm camcorder. Regardless of technical merit, 8mm is a big plus in weight. In addition, the 8mm cameras all seem to use those little tiny batteries available at Radio Shack for $30, not the mucho-bucks of the big camcorder batteries.

You can get super VHS, or super-Beta camcorders, but 8mm gives as good a picture as your likely to see with home recording, and the sound is not linear on the tape. I bought a cheap 8mm and they do cost a lot more than most VHS stuff, but just have her TRY one, and you won't want anything else.

I would be very grateful if I could get a software for self learning Morse code
for Macintosh, I have to learn Morse code to get my hem. radio licence I live
in the wilderness so I can't learn it no other way.
please e-mail your answer

Thanks, Avi

Before we all get too sophisticated and debunk all of these stories as urban legends, at least one of them recently was on the level, CNN even had pix of the kid.

There have been various discussions on small HF radios; nobody has mentioned the Mizuho 'MX' series; Only 2 watts o/p, but SSB (and CW for the diehards) available on 80, 40 and 20 meters (different radios for different bands!).
Use VXO control (so you only get 25 or 50KHz per xtal). Has IRT, noiseblanker, s-meter etc. Lovely and small! (66 millimeters by 39 millimeters by 142 mm)
Runs off nicads or external supply.
The radios cost 189 pounds sterling each, but thats after all the execrable taxes thrust upon us Britishers by the Government and the European Community bureaucracy;- Statesiders or anyone going to Japan should get significant

discounts, we just pay through the nose :-((
I wonder how far 2 watts will go on these bands - could we be seeing the
emergence of the 'HF Handie-talkie' ???

*** Hey, why not _combine_ the two activities? Yes, I'm talking about..... CW in foreign languages! Now, on phone, if some foreigner gets the mistaken notion that you speak his language, he can overwhelm you with chatter! Not so in CW. If your high-school whatever isn't too rusty, you can probably read what you copied on the paper, no problem. Much easier than understanding foreign language voice.

What you heard was Cuba's "Radio Reloj," literally translated as "Radio Watch." It's a nationwide network, heard on multiple MW freqs across Cuba. The Spanish speech over the time signals is news broadcasting. If it helps, imagine WWV with news superimposed on it :)

Radio Reloj seems to be a fairly common format in the Caribbean; a quick flip through WRTH shows stations in several countries, including Puerto Rico and the Dominican Republic, with similar formats. Cuba's is especially noticeable because it's on so many high powered MWs. The 570 kHz freq is supposed to be particularly strong. Hope that helps.

DISCLAIMER: I don't even speak Spanish. Why should you trust _me_?

I'v been reading some articles lately about certain types of

ham radios having their brains scrambled when their lithium
batteries run out. I was wondering if my ICOM IC-745 is
doomed to suffer from that type of disaster. Is there anything
I can do to prevent it? Is it going to lose all it's brains, or
will a new battery after the old one fails bring it back to life?

If it going to be a disaster, how much will it cost to fix?

Any ideas?

There used to be a west-coast swap net that met at or around 7265 kHz on saturdays & sundays at 1:00 in the afternoon. Does anybody know if this one's still around? I listened for it a couple months ago and nothing heard. Maybe it's moved? Or maybe 40 was just in the dumps that day? Help! The foothill College swap meets have closed for the winter, and I need my electronics junk fix!

>$30, not the mucho-bucks of the big camcorder batteries.

Picking a camcorder isn't as easy as choosing the lightest unit. There are many tradeoffs and due to the significance of the investment it is worthwhile to do some investigation. The 8mm units are small and light but overpriced due to the manufacturer's monopoly on the format. Their tapes cannot be played back in the home vcr. They use nicad batteries that have very limited capacity, easily develop memory, and self-discharge rapidly (which means that when you pick up the camera after not using it for a month the batteries are half-dead and will expire just as junior blows out the candles). The cameras are small and due to their design the weight must be borne completely by the hand rather than resting on the shoulder as the larger units do. They tend to bob around alot when handheld because of the way they are held. The resulting movies are hard to watch. The larger VHS units are easier to hold steady, especially for long periods. They cost much less than 8mm for the same features. VHS Tape is much cheaper and plays directly in the home vcr. The batteries are gelled lead-acid and don't develop memory or self-discharge quickly. They are much cheaper (for a given capacity). One inexpensive GE VHS camcorder I looked at recently would run for 3+ hours on one battery. The 8mm units generally poop out in way under an hour. The VHS batteries are generally available for around $40. The large capacity batteries the 8mm units need to run even one hour cost closer to $100 and stick way out the back of the camera and make it much heavier than it was with the stock battery.

Still, the 8mm may be the best for her -- but some thorough investigations are warranted.

>You can get super VHS, or super-Beta camcorders, but 8mm gives as good
>a picture as your likely to see with home recording, and the sound is
>not linear on the tape. I bought a cheap 8mm and they do cost a lot
>more than most VHS stuff, but just have her TRY one, and you won't
>want anything else.

If I remember correctly the original post was for info on a newsgroup that might have more info on picking a camcorder, try rec.video.

Andy....The Puff MicroStrip Program plus Manual was originally free from
Prof David Rutledge at California Institute of Technology, Dept of Engr'ing
Pasadena, CA. 91125 or Call 818-356-2137.

Since the Grant to supply these has run out, he's asking somewhere around $10
now for the upgraded version. I've used the first version and it seems to
work out just fine as a functional as well as educational program. I have'nt
used the plotting routine yet (no plotter) but you can make proto boards from
the artwork.

I'm curious where on the license it says this. Mine doesn't say anything
like this. I got my first license in 1986 and it didn't say anything then
so I guess they changed it sometime between when yours and mine were issued.
--

```
--Phil Howard, KA9WGN-- | Individual CHOICE is fundamental to a free society

----------
```

My current license (which I obtained in 1984 at the Seattle FCC office) required that I pass a 20 w.p.m. code test. Therefore the implication of holding the license is that I have passed the test and thus should know the code.

If you hold a X class license - it should be fair to assume that (at one time) you knew the code well enough to pass the test to acquire that license. The only alternative is that you cheated.

I know of some cases where folks holding a "conditional" class license were required to show up for re-examination. This license was the same as the current general class - only it was given by a single volunteer examiner. Needless to say, folks cheated. (i.e. Bring over a bottle of booze and we'll take your test.)

Back in the early 70's it was a renewal requirement that you sign a statement saying you had spent some trivial amount of time operating and that you still knew the code.

ENGINEERING ASSISTANCE NEEDED:

I am trying to get an engineering drawing for a telescoping tubular tower manufactured by the now defunct Wilson Systems Inc. formerly of LasVegas Nevada.

I understand that this was sold to "TRISTAO"something.... but info on them is scarce.

Any ideas? The city is giving me lots of grief on stamped drawings (in addition to other things) and a drawing would be alot easier than sawing off a sample of each tube and paying for metallurgical studies.

TNX de WA8ZHN / PRBWON: still fighting.

>ain't much.

There was an article in 73 magazine describing how to replace the 2510 finals and get the output up in the 60..70 watt area. That's 10*log10(70/25) = 4.5 db. Still less that 1 S unit (6 db) but a noticeable improvement.

Personally - my 2510 works just fine at 25 watts. No need to mess with it. I worked two new states in the big pizza contest and Sweden before work this morning. My biggest complaint with it is the lack of a low power button like the Radio Shack version has.

When I designed the channel selector circuit in the Drake MRT-55 way back when, I remember that the channel numbers were not sequential (in frequency), and I seem to recall some of the channels were receive only. My memory if foggy on this, tho. (It has been 15 years.)

I like the feel, but never noticed the sound problem until I tried to use one in a voice ham radio contest. Every time I typed a key, it would trip off the VOX (voice-operated relay) and I'd miss part of what I was trying to copy down. Fortunately, I found a quieter keyboard to use for the European runs the next morning.

Attention...members of the Motorola Amateur Radio Club....

MOTOROLA AMATEUR RADIO CLUB JACKET ORDERING TIME IS NOW AT HAND...

The jacket will be (like last years model only newer..) the windbreaker style, royal blue in color with lining and white lettering printed on the back (with the Motorola ARC logo) and your name and callsign Stitched in white thread on the front. The call sign will be in block letters and the name is in script font. The price below includes everything..tax, printing,stitching and delivery. The Deadline to order is 14 December 1990.

Sizes and cost...

S,M,L,XL (these are normal sizes)	$29.03
XXL	$32.74
3XL	$36.03
4XL	$40.03

Checks only, made out to the Motorola Amateur Radio Club

Contact Steve Sagerian @ 2-4614

Limited offer, void where prohibited, operators are standing by..

Looking for a Belcom FS-1007P (for purely sentimental reasons).

Anyone out there (probably in JA land or Europe) got one they'd
like to sell??

The Mizuho 'MX" series, 6 and 10M versions, were sold by AEA for a
while as the "DX Handy", as far as I can tell.
They seem to have closed them out, and there's a surplus place that
still has some 10M units left. Look in the latest isssue of CQ, I
think.
I need a manual, and antenna for a 10M unit, if anyone knows where I

```
might get them.

The problem with that interpretation is that it fails to survive Occam's
Razor:  Why should operation of a repeater / patch be different on 220 and
up than on 10, 6 and 2m?  Clearly, the law is not logically consistent...

Whilst we're on the subject, I wonder how thrilled the CELTEL folks were with all the news reports over the weekend about the Irish member of parliament who got into hot water because someone with a scanner recorded and published his CELTEL conversation in which he called British Prime Minister Thatcher a "fat cow"?

ARRL BULLETIN 45 ARLB045
FROM ARRL HEADQUARTERS
NEWINGTON CT NOVEMBER 10, 1990
TO ALL RADIO AMATE}RS

A NOTICE OF PROPOSED RULEMAKING LOOKING TOWARD VARIOUS MINOR CHANGES TO AMATEUR RULES WAS ANNOUNCED TODAY BY FCC. THE NPRM IN PRIVATE RADIO DOCKET 90-561 RESPONDS TO PETITIONS BY ARRL AND THREE INDIVIDUALS. THE NEWS RELEASE MENTIONS SOME OF THE ITEMS IN THE REQUESTS, BUT DOES NOT IDENTIFY WHICH SUBJECTS ARE ACTUALLY BEING PROPOSED. THE COMMISSION SEEKS COMMENTS ON SOME OF THE IDEAS, BUT DISMISSES OTHERS AS REPETITIOUS OR NOT WARRANTING CHANGE. THE FCC PREDICTS THAT THE TEXT OF THE NPRM WILL BE RELEASED ABOUT NOVEMBER 19. COMMENT DEADLINE IS LIKELY TO BE IN LATE JANUARY, AND REPLY DEADLINE LIKELY TO BE IN EARLY MARCH. PLEASE WATCH FOR A FURTHER INFORMATION BULLETIN IN TEN DAYS OR SO.

Dear fellow homebrewers,

I want to build a simple SWR meter which still works at VHF and UHF. Specifically, I want it to set up a 70cm antenna. I don't need absolute accuracy, simple relative F/B comparisons are all I need to resonate the d.e.

It should be easy to reproduce (eg. stripline on PCB), and it must not use any of those isolationist US components which do not exist anywhere else in the world (ie. there must be NO references to an inductor with a footnote which says "available from USA-Q Inductors, 1119888 USA Rd. USAtown).

Can someone give me a reference to a construction article in a technical magazine (eg. HR, QST, Handbooks)?

Any help leading to a successfully procured article will be greatly appreciated and will add another satellite user from VK to the bird!

>>Here's my modest proposal: provide (small) code-free [vsu]hf subbands.
>>If they turn into glorified CB bands, then don't give them any more
>>bandwidth. If they turn into real technology mills, then expand them.

>
>My argument against this is that small subbands won't produce any usable
>results due to:
>
>1. Subbands might be too small.

NIMBY is just what I had in mind. Define some proportionately-sized
subbands. I don't want all of >30 MHz turned over to to these new
licenses until they can prove they can behave themselves. I used to be
a CBer, good buddy, and NIMBY essential for me to support a codeless
license that (presumably) will attract the masses.

>2. Semi-ghetto effect due to lack of contact with hams on the "main"
>   subbands.
>3. Duplication within these subbands of band planning done elsewhere
>   and resultant planning/ccordination problems.

This is provably false. Look at the current incentive-induced Novice
ghettos, and tell me that you still belive this. Gentlemen's agreements
for DX, ATV, packet, et.al. grow from the allocation. That will be
the first test - can the NoCoders be Gentlemen ?

>>Two guys here knew they
>>were being hazed, but then got into the challenge so much, they went for
>>13 WPM !
>
>And what if they had NOT been hazed? Might they be going for 20 or even 35?

Well, I'm one of them, and I'm at 20 seconds of solid copy at 18 WPM. I
see it as a challenge, and much more real-world than watching TV,
playing computer games, working DX, or any of the other Great American
TimeSinks.

>>For anyone who plays Tetris, or any of those video games, Morse Code is
>>like making it to Level 5, 13, or 20. I've watched my wife spend hours
>>trying to hit level 10 / height 6. No difference. She could have been
>>at 13 WPM by now.
>
>OK, so when do we see the "Morse Code Game"?

It's currently playing on cassette players across the country. Sigh, no
blinkenlights or whizzengrafics.

Attitude, my friend, it's all in the attitude. It is a game if _you_
define it to be (just like life, but I wax philosophical). The problem
is that Morse is an audio training exercise, and any video is a
distraction. Pretty low tech, I'm afraid.

>>Agreed. But the purpose of ham radio is not efficient communications.
>>(Boy, am I going to get flamed for that.) The purpose is to _develop_

>>and _test_ efficient communications (like packet, new modulation
>>techniques, etc).
>
>One of them, anyway.

Right. We occasionally do public service and other stuff.

>>Then we need to create a VHF-and-up license class. But, if that happens,
>>I want large Communicator-free subbands. If the usage patterns explode
>>like everyone predicts, then give them more spectrum. If they behave
>>like cretins, take away some spectrum.
>
>How large? Where do you divide the spectrum? Specific ideas?

Hey, I don't know ! If I did, I'd have some specific suggestions. My
off-the-cuff impulse is to make Communicator a sub-band within the
Novice subband on >30 MHz. If the subband doesn't exist, create one
like that found on HF. I'd suggest an initial allocation of 10-20% of
the (sub)band. I think we have enough on 1200 MHz and up to allocate a
couple ATV channels.

In article <17190@shlump.nac.dec.com> magid@esis.enet.dec.com (Joel Magid...)
writes:
-
-    Should we continue to issue Extra Class licenses in the current
-    manner ?
-
-    Should we not reserve this class for those who can really
-    demonstrate the capabilities beyond the norm that we see
-    today and have done so maybe for the last 10 or 20 years.

I've only been a licensed ham for about one year now, but I've been interested in the hobby and have listened in for about 10 years. After hearing some of the absolutely moronic and obnoxious things done by extras (not to mention watching one blow out the finals of a radio 'cause "He was an extra and knows how to tune a radio") I'd have to agree with you. I'd like to see a license class or endorsement the translated into real respect for _proving_ that you possess the _spirit_ of amateur radio, not just the ability to memorize a multiple-guess question pool.

Does anyone know if there is a listing of packet BBS's which also
have a connection to the internet via the ampr.org domain? I
would be interested in a copy if there is one online somewhere.

thanks,
                         - tom

 Article 10475 (5 more) in talk.politics.mideast:
 From: endelman@wellworld.Sun.COM (Aaron Endelman)
 Subject: Re: ARF ENDS BOYCOTT

 >ARF is Schmidling's "Amateur Radio Forum".  I read
 rec.ham-radio and it seems that he uses the 40 meter (7 MHz)
 ham band to preach his political gospel, which is
 probabilistic given FCC restrictions on the content of
 amateur transmissions.
```

ARF says:

Interesting word, probabilistic. If you are questioning the legality of ARF, give up. The Forum is not only well within the legal constraints of amateur radio, it is very popular and probably the only worthwhile and constructive use currently being made of the amateur frequency allocations.

> The ham who commented about it in rec.ham-radio found it a dubious and annoying use of bandwidth and that it was pretty much only Jack doing his thing and didn't involve other hams.

ARF says:

I hate to burst your bubble, but I stopped keeping records when the "roll call" reached 1000. That's 1000 different hams actually participating in the discussions, not to mention those that just listen, in addition to tens of thousands of shortwave listeners. I receive cards and letters from listeners all over the world.

In addition to our own discussions, I frequently interview guests and field questions and comments for them. Among the notable guests:

Jerry Levin	former hostage, CNN bureau chief
Rob Sherman	American Atheists
Paul Findley	former congressman
Wayne Heimbach	Amnesty International
Rashid Khalide	Prof U of Chi
Jay Miller	ACLU
Dr Ron Pine	taxonomist, Field Museum
Dr Louise Cainkar	Pal Human Rights Info Center
Mark Bruzonski	Jewish Committee on Mideast
Abdul Wali Mohammad	Nation of Islam

It is typical strategy of your type to belittle what you can not deal with in any other way but for the benefit of those who really care, the schedule for ARF is:

Thursday at 9:PM Local time in Chicago.

The frequency is 3.950 MHZ, LSB.

Unfortunately, you must have a short wave receiver capable of single sideband reception.

....

If you have had it with the "best congress money can buy", e-mail to arf and I will send you info on how to do something about it.   DO IT NOW!

****

If you have received the info, email to arf for the
current......... ARF ALERT.   Specify "Alert Only"

In a recent posting, Phil Howard asked about a separate VHF sub-band or channel for packet DX. Astonishingly, I agree with Phil. Packet DX can be a load of fun. During an Es opening a couple of years ago, my packet logger overflowed with W5s in about 5 minutes - quite a bit faster than I would have been able to work them manually. Luckily, I live in an area where loacl packet activity was low at that time, otherwise no DX could have overcome local QRM.

A separate packet band, well removed from the weak-signal areas of the VHF bands, would be ideal. Perhaps the region just above the beacon bands on 144 MHz and up? You'd only need about 25 KHz, I think.

The trick, of course, will be in keeping these channels free of local

traffic. We've been fighting that battle on the SSB calling frequencies
and the 6-meter DX window for a long time...

Subject: Updated Macintosh Ham Stacks (for HyperCard) now available
Message-ID: <39651@genrad.UUCP>
Date: 14 Nov 90 12:52:41 GMT
Sender: news@genrad.UUCP
Lines: 62
Posted: Wed Nov 14 13:52:41 1990
```

This is just to let you know that I've finally updated the Ham Stacks to the latest
question pools. It has been a long hard battle, since I have been unable to GET
the latest question pools until just recently. My thanks to Stan and Peter and ARRL
and W5YI (and others) who helped point me in the right direction.

Anyway, here's the scoop. I've created 5 Hypercard stacks which allow you to test
yourselves realistically for that upcoming license upgrade. Each of the stacks has
the entire question pool in it and it will automatically generate a pseudo-random
test of the correct length (for example, 30 for the Novice) AND the right subdivision
question mix at the beginning of each test. Each will automatically score you (and
even clap hands if you get 90 or above) at the end of each test and will tell you
which questions you missed and give you the option of reviewing these missed
questions.

There are other features as well. You can print a "test" to be given to others. It
even prints the question key. Be aware, though, printing a "test" takes a LONG time,
but it does work. You can also print just the score sheet (along with the question
key) if you wish to keep track of how you're progressing. You can set the test to
provide automatic feedback of question correctness, or to only tell you which you
missed at the end of the test. This makes it QUITE nice for using the Novice test
to ACTUALLY test prospective Novices and it IS legal (I have spoken with some VE's
about this). There are some extra, slightly manual, hooks that I've placed into
the Novice test, to facilitate giving these tests to Novices (these hooks are NOT
documented, since I'm still playing with them).

These stacks are only available for Macintosh computers, so please don't ask me if

you can use them on an IBM.....you can't. These stacks also require that you already have HyperCard which is a software tool which is shipped with Macintoshes nowadays.
I will not send you HyperCard; if you don't have it, speak to your local Macintosh dealer. Note that HyperCard requires at least 1Megabyte RAM and PREFERABLY a hard disk drive.

The latest version of stacks are as follows:
- Novice Ham Stack v3.0
- Technician Ham Stack v3.0
- General Ham Stack v2.0
- Advanced Ham Stack v2.0
- Extra Ham Stack v2.0

These may be obtained directly from me by sending a SASE (self-addressed stamped envelope) and 800K diskette (be sure the SASE is suitable for the diskette). The stacks are shipped in a compressed format, but the decompresser is also provided on the diskette. In unpacking them (onto another diskette or hard drive), my only recommendation is : BE PATIENT. The unpacker is SLOW and doesn't provide any feedback that it's doing anything for about 2 minutes, but it does work.

Evenutally, these stacks will be available via anonymous ftp thru Patty Winter (winter@apple.com) or her associates. I do NOT have the ability to send these via email or anonymous ftp, so don't ask. Other bulletin boards may also have these available (for example, the one in New Hampshire thru WD1V), and I have no objection to anyone making them available to other people. This software is PUBLIC DOMAIN and may not be sold by ANYONE except me, and I'm not selling it.

Excerpted from "Broadcasting" magazine of 11/12/90 (without permission):

> Floyd N. Lantzer, 84, engineer, died of kidney and heart failure October 27 at Bethesda North Hospital in Cincinnati. Joining WSAI(AM) Cincinnati in late 1920's as engineer, Lantzer later joined Crosley Radio Co.'s co-owned WLW(AM) in Mason, Ohio.
>
> Credited as engineer who gave WLW around-the-world reception with 500,000 watts in 1934-38, Lantzer retired in 1968 after 40 years with station.
>
> Lantzer was also amateur radio operator for 60 years.

There are few radio enthusiasts who have not heard WLW, even at its present 50,000 watt power level. The stories about the 500,000 watt operations are legendary, and Mr. Lantzer must have been quite a person.

Just thought that his passing should not go unmentioned. Perhaps some other rec.ham-radio readers knew him personally, and could share some details of his work. As a former broadcast engineer, I'd sure be interested.

Try page 11.9 of the RSGB's excellent book "VHF/UHF handbook" (probably
available from the WIA (or even Dick Smith)).
There is a description of a precision-type reflectometer and a general
purpose directional coupler.

>
>It should be easy to reproduce (eg. stripline on PCB), and it must not use

Over here in the good old us of a directional couplers are almost always
to be had at ham-fests (of which there are many over the summer), but
alas in Oz there are very few (and very little gear available)

Pardon the intrusion, I rarely get into this sort of thing. I have done a lot of canvasing of my friends and it seems that the ENGLISH language in its many variants is the only genderless language. This is to say that nouns have no gender association and that verbs conjugate without gender based rules. As far as I have been able to establish, all other terrestrial languages have gender based structure and rules: Asiatic, African, European, Oceanic and Native American, even classical and most "extinct" languages.

Yes, it is curious that we mantain links to our linguistic roots by referring to automobiles with feminine endearments, fishes and fauna with masculine explative etc. Yes, it is true that much of the language is gender oriented but, in the case of common discussion and general text it is not inappropriate to refer the "common person" as either a masculine or feminine entity. The usage of a singular gender in these cases is NOT an affront to the "common person". What is an insult to the "common person" is that such references are demonstration of insensitivity.

Indeed, any such uncontrolled speech or idea is now taken as lacking in sensitivity. As for me, my sensitivity (minimum detectable signal) has been breeched. Is it not intriguing that this thread of discussion began as a posting of non-ham activities at a convention? I will let you draw your line from that.

>Most phone DXing and contesting is conducted in English (well, most is in
>Amurrican but we'll overlook that). Suppose you were Japanese, didn't speak
>English, but got interested in amateur radio and DXing. Do you really think
>that learning cw in order to do cw DXing would be such a terrible thing when
>compared with having to learn English in order to do phone DXing?

Let's see "w4xxx this is ja1xxx you're 59. Please QSL. QRZ?". Change the first callsign and you have the total knowledge of English needed by ja1xxx to work DX. Nothing else ever changes. It probably won't take a DXer more than four or five hours to memorize that. Then he's set for life on ham radio.

>What's my point?   Just that the dislike of cw among some of the people on
>this net is probably conditioned by the fact that speaking English is not a
>problem for them. If international communications were all either in CW or
>in Japanese, you would be facing the same sort of choice that many Japanese
>face in getting on the air.   It also means that if you want to work lots of
>JAs and UAs it is a good idea to stay fluent in cw.

Let's see "W4XXX DE JA1XXX UR 59 PSE QSL QRZ?" The DX exchange still looks like English in CW, it just takes longer to send. Course you could program a memory keyer so you could be catching up on your log while the "communication" is taking place.

>I don't see a lot of difference between the attitudes "they should all learn
>my language" and "I shouldn't have to learn cw", or, for that matter, "why

>fraction of all the "foreign" stations will still be using cw because it is
>easier than learning English for many of them.
>
>I also realize that I am equating "HF operation" with "DXing" but I think of
>them as the same thing. I don't go on 20m in order to talk with people in
>the same country, although some people obviously do - they need professional
>help :-)

I agree with Derek that content free contacts can be done as easily with CW as with phone, it's just slower and more tedious and you have to learn a manual encoding method to do it. But I believe that real communication of real ideas is more important than content free DXing. To do real communication both parties must share a common language of ideas, a natural language, and not just a common encoding method. Real conversations conveying real ideas are possible using Morse encoding, or RTTY encoding, or even voice, but a common natural language is a necessity. The only modulation methods that can convey ideas between people that don't share a common natural language are pictorial (SSTV, FAX, FSTV). And even then visual symbols don't always translate into the same internal natural language ideas.

Derek, if the sum of your HF ham radio experience is limited to DX exchanges, you're missing out on a grand opportunity to learn what the rest of the world thinks and feels. It's worth your time to learn a little conversational Russian, or maybe your college German or high school French will come back to you with a little practice. You know, some parts of the world even speak English, like Australia, New Zealand, the subcontinent of India, South Africa, even England. It's estimated that nearly 80% of the world's population knows at least a little English. Try actually talking with some of them, you might enjoy it.

In article <2451@dover.sps.mot.com> waters@darla.sps.mot.com (Strawberry Jammer) writes:

> What I did was to buy the Diamond dual bander (yes I know - $$$, but then the 24AT isn't peanuts either!). Its around 15 inches long and actually has a GAIN rather than the loss you see with a "duck". Only disadvantages are the price (around $75 as I recall) and the size which makes it hard to

I think they go for about 1/2 of that. I have one and I don't remember paying that for an antenna.

> Remember you ae losing two ways with the ICOM "rubber duck" - its shortened AND its dual band. Should still hit the stronger repeaters around though.

I don't believe that there is anything inherently bad with a dual band antenna. The makers frequently make compromises but there is no reason that a dual band antenna has to be worse.

To change the subject slightly, I have heard two rumors now that there is a mod for the 24 to allow real out of band TX, like 900 meg!!! I have performed all the mods I know about and although the freq range was greatly extended it did not include 900 meg for tx. Has anyone found this mod and tried it?

I am aware of the On-line US callbook that can be accessed via Internet. Does anyone know of a similar database for international calls? How about an international callbook on CD ROM?

As a data point: I believe Austin Custom Antennas uses PVC pipe
in several of its designs, as the "radome" outer covering. One comment
was that it stands up to certain types of harsh weather (sandstorms?
Bright sun? I don't remember...) better than fiberglass.

So you should be in good shape with that approach, provided the piece
of PVC in question passes the microwave oven test.

Sorry to digress, but I'm looking for information for a friend who wants to get a camcorder for baby pictures. She's torn between 8 mm and VHS. Anybody know of a newsgroup or mail list where I can find out more about the pros and cons of each?

I suspect the reason for the phone numbers was so that the "business" aspects like "How many $$$?" and such could take place off the air, where most hams believe they belong.

Many local repeaters also have a swap net on a weekend night (ours is sunday) and go through "Have" and "Want" lists, updating them... yes, phone numbers here too...

You may want to inquire locally about such a net on 2 meters, and try that as well.

Yes PVC pipe is sometimes quite lossy (depends what the manufacturer uses as a 'filler' material). I once wound an ATU coil on some PVC pipe, it
made a fine dummy-load.
Polypropylene pipe (as used for domestic plumbing, as opposed to rainwater) is probably a better bet; i have used the small-bore stuff for antenna loading coils in the past (make up end-plugs out of short lengths of alloy rod to take the whip elements). Only problem is, in long lengths the pipe is quite flexible. Maybe this would be an advantage in windy locations?

Sorry for the distribution to the whole net, but was unsuccessful with direct.

To: Nick Bristow, G1LYX

Hi Nick,

I see that you mentioned ST stuff. Are you also interested in Atari 8-bit stuff? If so, I have written a few programs in BASIC for electronics/ham and have many other programs on electronics on disk.

I would be happy to supply them to the library.

Recently there was a notice saying

> Craig Shergold ... is a seven year old boy with an inoperable tumor on his brain. He has not been given a very long time to live and it is Craig's ambition to enter the Guiness Book of World Records for the largest number of get well cards ever received by an individual.
>
> Please send your card to: ...

The story is almost certainly an urban legend. There is a reasonably good chance that Craig Shergold does not exist. If he does exist, there is a very good chance that he doesn't want a jillion postcards raining down on him.

As has been widely documented, (see e.g., Brunvand's books on urban legends; I don't remember which one has ``the story of David''), there are a long series of stories just like this, usually about a young male child named `David'.  `David' is allegedly dying of an inoperable brain tumor whose ambition it is to get the largest number of postcards and make it in to Guiness before he dies. `David' usually lives in Florida.

Usually, there is no such child. In one case, there was such a child, he was not dying of a brain tumor (or anything else), and he was royally pissed off at getting thousands of unsolicited and unwanted postcards.

The legend is pervasive enough that it requests for postcards have shown up in newspapers and on radio. There have been several such net postings for postcards. One was so widespread that the moderators of ``news.announce.important'' (which goes to all sites in the world and has only a few articles a year) had a request to please ignore the rumors.

What should you do? Two things. First, don't send a postcard. Second, tell everybody that you've told -- and everybody who told you about the card request -- that this is an urban legend and not a real story.

;-D on (Now about this bridge with a tumor...) Pardo

Dear NetFolks,

We would appreciate your responding to the request of Craig Shergold who is a seven year old boy with an inoperable tumor on his brain.

He has not been given a very long time to live and it is Craig's ambition to enter the Guiness Book of World Records for the largest number of get well cards ever received by an individual.

Please send your card to:

Craig Shergold
% Children's Make-A-Wish Foundation
32 Parimeter Center East
Atlanta, Georgia 30346

===================================--

Letters similar to this have been sent out by traditional mail to large organizations all across the U.S. on Craigs behalf. Instead of passing it on by land-mail, I thought the net would be a great way of getting the word out to as many people as possible in as short a time as possible.

Please pitch-in & send Craig a get well card, and by all means feel free to circulate this letter to local businesses/organizations, or other BBS's you may belong to. All your help and effort will certainly be appreciated! Thank you.

Sincerely,
Jack Petrino

> JAs and UAs it is a good idea to stay fluent in cw.

If you stick to Q-codes and RST reports, CW is a universal language. CW does not, however, magically translate Japanese into English (a popular misconception).

> I don't see a lot of difference between the attitudes "they should all learn
> my language" and "I shouldn't have to learn cw", or, for that matter, "why
> can't you get a decent hamburger and fries in Burkina Faso?" (sadly, you
> probably can).

So why NOT learn their language?

I started to work towards 20 WPM after passing the Extra written test 2 years ago. A year later, I could copy around 10 WPM, and credit for the written portion expired. I don't work CW by choice, and I find tapes, computer generated code, W1AW too boring to stick with.

Instead of code, my current project is to try to recover some of the foreign language knowledge I had in high school and college. I've ordered the Amateur radio phrase book form the Finnish Amateur Radio League, and I'm listening to QSOs in other languages while I'm waiting. Why bring this up? I think that it would do wonders for "International Goodwill" if English-speaking hams could say even a sentence or two in the language of their contacts.

> Meanwhile, a good fraction of all the "foreign" stations will still be using
> cw because it is easier than learning English for many of them.

If all they want to do is exchange callsigns and signal reports.

.... Is it not intriguing that this thread of discussion began as a posting of non-ham activities at a convention? I will let you draw your line from that.

Ron, K3FR

Actually, that's not true. The only link is that I initiated both subjects. I posted something about non-ham activities at a hamfest being entirely for women, and I later posted something about DXing certificates referring to "his station" etc. There are not many women in ham radio, and I think both of these situations perpetuate the idea that hamming is an all-male hobby. It's not only in this country, either - all I have to do is to send my call at someone in response to a CQ, to get "GE OM, tnx fer call" - and you can't tell me that women and men sound different on cw. People even have QSL cards printed with "tnx for QSO OM". Not all hams are middle-aged white males with beer bellies and baseball caps. Changing the wording on certificates seems a minor thing to do, yet I've seen many postings from people who tell us that "his" means "his or her" and it's perfectly OK to refer to "his station" on a certificate awarded to a female ham. Am I just unusually enlightened or something? ...

BTW, the above is not meant as an attack on the poster - I read his posting a few times and still don't understand what he was saying :-)

Argue all you want about the merits of testing for CW as a prerequisite for getting a HAM license, but there's something missing if you don't know and use it.

I passed my General CW portion on a wing and prayer, and I never intended upon using CW since I love computers and digital modes. But, have you ever noticed how educated and truly noble many of the CW operators are? They are very courteous and most love to help Hams develop their CW skills. CW operators are getting statistically older as younger Hams opt for the easier modes. I love talking to these older guys. They have such a wealth of knowledge and experience that is unique to CW. Many of them only use CW. I could listen to their old stories for hours.

I want to meet more of these Hams before they leave the hobby, for whatever reasons. So, if I have to learn CW (25 wpm) do it, I'm gonna. And I know I'll be glad I did. Extra class, look out!

I hope CW never dies and that CW operators continue to epitomize what's good and fascinating about Amateur Radio.

Several years ago I heard an unidentified piece of music which piqued my curiosity and I since then I have wondered about just who it can be attributed to as well as any background on it. Let's see what those of you who provided so much information on YYZ last summer (as well as any others) can come up with on this one.

The recording starts up with the sound of atmospherics and several hissing (no BFO) CW signals. It sounds like a receiver with a wide IF and an AM detector parked in the CW portion of one of the HF marine bands (8 MHz for example). Then a female voice comes in reading what sounds like a marine weather report only to drowned out by the band.

Throughout the whole song the lead guitar cranks out SOS in Morse.

My memory of the lyrics is sketchy, but I do remember that the word "stranded" is used heavily, probably more frequently than any other. Another line I recall is "better get the breakdown squad out, to get me rollin' on", or something like that.

The piece ends much like it began, except in reverse order. The weather report fades into the CW through an AM detector and noise and this then fades into silence.

I heard this music on a cassette which belonged to a young man who was several thousand miles from home at the time. He said that he had recorded the tape from an album belonging to his brother and that he had no idea what who the artist was or what the name of the slelection was.

Does anyone on the net recognize this piece, know its name or who the artist is? If so, can anyone offer any further background. Its been nearly eight years now and I still don't have a clue.

73, Scott

>portion and just leave CW, USE, and LSB (packet)
                        ^^^^^^^^^^^^
```

Does it really matter which mode (USB vs LSB) one uses for packet? Using LSB vs USB could invert the tones (mark vs. space), but that shouldn't matter given the NRZI encoding of packet data (NRZI encodes data in transitions, not absolute mark vs. space). On 2m, I've seen stations which have the tones flipped with respect to each other; it doesn't make a difference there (as one would expect).

Then again, I've never used HF packet :-)

Should we continue to issue Extra Class licenses in the current
manner ?

Should we not reserve this class for those who can really
demonstrate the capabilities beyond the norm that we see
today and have done so maybe for the last 10 or 20 years.

Bunk or not, I don't see the ham radio connection, unless he wants to set the record for received radio-grams. We could merge 2 legends by sending a batch of cookies made from Mrs. Field's secret recipe.

PROPAGATION FORECAST BULLETIN 46 ARLP046
FROM ED TILTON, W1HDQ
SPRING HILL FL NOVEMBER 12, 1990
TO ALL RADIO AMATEURS

DURING THE FIRST WEEK OF NOVEMBER THE SOLAR FLUX ROSE FROM A LOW OF 140 TO A HIGH OF 215. IT THEN DROPPED BACK TO 193 ON THE 10TH BUT RECOVERED TO 197 THE NEXT DAY. SO FAR THIS MONTH CONDITIONS HAVE BEEN GENERALLY GOOD, EVEN UP THROUGH 50 MHZ, WHICH WAS QUITE BUSY THIS PAST WEEKEND.

FOR THE PERIOD BEGINNING NOVEMBER 6, THE FLUX HAD REACHED 190 OR HIGHER WITH A PEAK OF 215 ON THE 7TH. IN NOVEMBER THIS IS HIGH ENOUGH FOR 50 MHZ DX AND FINE FOR WORLDWIDE WORK ON 28 MHZ. IT IS NOT TOO HIGH FOR MOST OTHER DX ACTIVITY. THE MUF MIGHT FALL BACK SOME DURING DECEMBER, BUT THE DX PICTURE SHOULD REMAIN GENERALLY GOOD THROUGH EARLY SPRING.

FOR MORE ON THE DX PICTURE WE RECOMMEND USE OF THE CHARTS THAT APPEAR IN EVERY ISSUE OF QST, USUALLY NEAR THE DX COLUMN. THE SIZE OF THIS FEATURE HAS BEEN REDUCED BECAUSE SURVEYS HAVE SHOWN THAT FEW AMATEURS MAKE GOOD USE OF IT. THIS MAY COME TO A, "USE IT OR LOSE IT," SITUATION IF EVIDENCE SHOWS THAT MANY READERS CONTINUE TO PASS IT BY.

AMERICAN SUNSPOT NUMBERS FOR NOVEMBER 1 THROUGH 7 WERE 71, 96, 113, 136, 158, 161 AND 198 RESPECTIVELY, WITH A MEAN FIGURE OF 133.3. SOLAR FLUX NUMBERS AS REPORTED BY WWV FOR THE SAME TIME PERIOD WERE 145, 140, 151, 156, 170, 198 AND 215, WITH A MEAN FIGURE OF 167.9.

gary@ke4zv.UUCP Mon Nov 12 09:38:39 1990 says:

>>Derek, if the sum of your HF ham radio experience is limited to DX
>>exchanges, you're missing out on a grand opportunity to learn what
>>the rest of the world thinks and feels. It's worth your time to
>>learn a little conversational Russian, or maybe your college German or

>>high school French will come back to you with a little practice. You
>>know, some parts of the world even speak English, like Australia, New
>>Zealand, the subcontinent of India, South Africa, even England. It's
>>estimated that nearly 80% of the world's population knows at least a
>>little English. Try actually talking with some of them, you might
>>enjoy it.

>>Gary KE4ZV

Hey, I didn't say that I was guilty of this attitude, did I? I've used French over the air in working some African and European countries - the most recent occasion was with a Belgian, who pretended not to understand because he was from the "wrong" part of the country (bit of a faux pas there, I suppose). I have ragchewed (by which I mean spent more than 5 mins on a QSO :-)) with stations in all continents. I was the only participant to make an admittedly short speech in Chinese at a conference in Beijing (nobody really understood it, including the BYs, but I tried). I use the Chinese words for 'hello' and 'thank you' when working BYs on phone or cw. I've sent foot in all the countries you mention above (except for South Africa) and conversed with the natives. So I'm not as parochial as you might be implying. I'm even married to a foreigner (well, a VK3). Heck, I've even corresponded in French over e-mail (right, Patrice N6BIS?).

However, my point in the original posting was that having to learn a small amount of a foreign language is at least as difficult as having to copy cw at a measly 5 words per minute. All the postings I've seen in response have agreed that learning said smattering is easy and rewarding and helps one make contacts with 'foreigners'. I agree completely and think the same can be said for learning cw, except that 5 wpm doesn't get you very far in any language, including cw (as Julian N6ARE said in a posting, or perhaps it was in e-mail, it's like trying to hold a conversation by looking up one word at a time in a dictionary).

I guess I'm saying that "I don't have time to learn 5 wpm cw" is just like "I don't have time to learn the French for 'please', 'thankyou' or '73' ", whereas in both cases a little effort can repay enormous rewards in what you can achieve in international communications.

Now I suppose we'll get flames from those who can speak fluent Serbo-Croatian and Mongolian, but just can't handle dots and dashes :-) [and to forestall the expected, yes, I know that learning the basics of a foreign language is not required for a ham license while 5 wpm cw is...].

Did this come to you in a divine revelation, or isn't it just your opinion?

>You may have the best of intentions, but I don't think you
>know and understand what the future of the hobby has going for it in the next
>fifty years.

I don't think you do, either.

>The loss of valuable spectrum we can see each time the FCC says
>something is a direct result of the lack of growth because of efforts to keep
>out anyone not willing to become like you.

"Lack of growth" is due to a large variety of things, chief of which is the
TV, "Nintendo" games, and computers. I don't buy your argument that the
need to copy Morse at 5 WPM is the direct cause.

>So what conclusions can I draw?

The wrong ones, IMHO.

>I work VHF, UHF, and planning to go digital, and am also interested in VHF
>thru SHF SSB and CW and I am appalled by what I hear. How can I not associate
>a "stick to traditions only" thrust with a knife in the heart of the Amateur
>Radio Service.

If a "stick to tradition" attitude is a knife in the heart of amateur radio now, why was it not so in earlier years? Why, oh why, must we be constantly be propagandized with the idea that tradition is bad? Progress has been, and will continue to be, made while holding to traditions.

>I hope I'm wrong. I hope I'm just paranoide. But why do I
>keep spinning the dial down to the HF bands and hear people who make me feel
>bad instead of feeling profoundly proud?

Why do I keep spinning the dials up to the VHF and UHF bands and hear people who make me feel bad instead of feeling profoundly proud? There are bad attitudes and rotten apples all over, that's why; and I certainly can't see a no-code license improving THAT.

The point is, that none of the foregoing hyperbole is selling no-code, (or, for that matter, pro-code) and few people seriously believe that no-code is the panacea that will rescue amateur radio from (moot) death.

How comprehensive is "comprehensive"? I would hate to see Novice level entry eliminated altogether. On the surface, it looks like your plan would do just that.

Also, I would reduce maximum power to 200 watts for everyone. There's no earthly need for more than that and hasn't been since hams quit operating on 600 or 700 meters with rotary spark gap transmitters.

I recently purchased a Realistic Pro-2006 scanner and am very pleased with it. Now I want to combine it with my other hobby - computing. Is there any way this unit could be interfaced to a computer ? Does anyone make a kit, or has someone out there done it before ?

In particular, it would be nice to let the radio scan and have the computer log active frequencies for later research. Scanning is great fun, but it seems to be a perfect place for automation !

On another note, anyone have a list of mods for this radio they could mail to me - I've heard of a few possibilities that are supposed to exist, but have no particulars.

Thanks for any help !

Bob

>I think I have the perfect solution.
>
>Access to the CW part of the spectrum should be permitted only to
>those who know the Morse code.

The CW part of the spectrum is also commonly used for other modes, such as RTTY, HF packet, FAX,... Fragmenting the spectrum for a CW-only band (where no other modes are allowed) would be a waste of a shared resource.

>Access to other parts of the spectrum should be permitted only to those
>who have the appropriate skills. E.g., only people who can speak
>should be allowed to use phone, only people with functioning EME
>equipment should be allowed to bounce off the moon, etc,

Is this a variation of "if you can buy the equipment, you can use the resource" ? That idea sounds like elitism, although it does somewhat reflect the current reality.

"Appropriate skills" sounds like a variation for multiple operating test elements to replace the code element. That would drive the VECs buggy, and/or make it difficult for a prospective ham to find a VEC that could test him on his favorite mode.

>It's silly to require people to learn the Morse code in order to just
>be allowed to talk.

Tell it to the WARC - they're the ones that require Morse of HF users.

Re: Is he licensed ?

Good question ! What is your call sign, Karl ? If you don't have a license, come clean. A little study will yield a Novice or Tech ticket, and then you can do this legally on less-crowded frequencies. It's really worth it. Just some friendly advice from an ex-freebander.

Re: Will 40 watts really allow you to "talk some skip" better than 25 watts?

Karl, save yourself some $$$, and forget about the extra 15 watts. It will raise your transmitted signal less than one S unit. 10*log10(40/25) ain't much.

I've used 400 watts (vs 100) on 10 meters. Presumably, it should account for 6 dB more signal, but it's a waste on 10 meters. 10 meter propogation is a binary affair - either you do or don't, and no (reasonable) amount of extra power will help if you don't.

Subject: Phone patch by automatic repeater NOT LEGAL
Message-ID: <1990Nov13.010608.8311@ux1.cso.uiuc.edu>
Date: 13 Nov 90 01:06:08 GMT
Organization: University of Illinois at Urbana

Posted: Tue Nov 13 02:06:08 1990

97.205(e) Ancillary functions of a repeater that are available to users on the input channel are not considered remotely controlled functions of the station. Limiting the use of a repeater to only certain user stations is permissible.

Now the question is how to interpret the first part of this rule. One important question is what this rule means with regard to the autopatch functions of a 2 meter repeater. What is not clear is whether or not SOME control is still required, and if so, what kind of control that must be. We need to look elsewhere to resolve this.

97.201(d) An auxiliary station may be automatically controlled only when it is part of a system that includes a repeater station also being automatically controlled.

While this should easily allow for auxiliary links to other repeaters and to access a phone line remote from the repeater itself, it might not apply well to a case of the phone line attached to the repeater.

97.115(b) The third party may participate in state the message where:

97.115(b)(1) The control operator is present at the control point and is continously monitoring and supervising the third party's participation; and

97.115(b)(2) [restrictions on who may be third party]

This rule effectively requires a live, breathing, and licensed, human being to monitor the third party traffic. A phone line could be used as a control link to the transmitter, but only if the person at the other end of it is being the control operator. This is usually not the case and would fall under third party traffic.

So we can operate a repeater (and its associated auxiliary links) under automatic control, but we still need a real control operator if the repeater station is originating third party traffic. Even though 97.205(e) does not require the user be operating an auxiliary station just to use features of the repeater, 97.115(b)(1) still requires that a control operator be present somewhere.

97.109(e)   No station may be automatically controlled while transmitting third-party communications, except a station retransmitting digital packet radio communications on the 6 m and shorter wavelength bands. Such stations must be using the American Radio Relay League, Inc. AX.25 Amateur Packet-Radio Link-Layer Protocol, Version 2.0, October 1984 (or compatible). The retransmitted messages must originate at a station that is being locally or remotely controlled.

Well, that seems to completely exclude the possibility of an autopatch on an automatic repeater being legal. The automatic control aspect a repeater is usually operating under cannot be used to pass third party traffic. There must be a station who is the control operator (can shut down the station) who is monitoring the third party traffic. It is not control of the repeater that is at issue, but control of the third party traffic. The last part of 97.109(e) also indicates that even for packet, a real live control operator needs to be monitoring the introduction of messages into the packet network; a philosophy indicated in the rules that is consistent with the repeater situation.

The ARRL License Manual (which every ham who does not have any other copy of the current FCC rules owns, right? :-) talks about phone patches on pages 13-16 and 13-17 (8th edition). In the entirety of that discussion no mention is made of a phone patch being done via an automatic repeater. However on page 10-3 they do refer to control of a repeater, quoting:

> Only a digipeater operating at 50 MHz or higher can be automatically controlled when it is passing third-party traffic. A third party participates in amateur communications when you make a phone call with a repeater autopatch. This means that a voice repeater must be locally or remotely controlled and a control operator must be present at the local or remote site when the repeater autopatch is active.

So, I am not the first person to come to this conclusion. I'd have expected the ARRL to figure this out well before me since they have the "inside track" and a lawyer or two to go over it all.

Now of course the user of the "repeater" can become the control operator and take on the duties specified in 97.115(b)(1) but to be the control operator, a wireline (hard to do portable) or a radio remote control is needed. 97.205(e) simply means you don't have to be remotely controlling the actual functions of a repeater to use them. You can turn ON the phone patch and say something INTO it, and that much would be OK. But as soon as someone on the phone end says something, it becomes third party traffic. You have to become the control operator of the repeater, not just merely be the user of it, to allow third party traffic. Alternatively someone else can be the control operator. If the control operator is using a radio link to effect the control, that radio link must be an auxiliary station. If the user is doubling as a control operator, his control must be by means of an auxiliary station operating under the rules of an auxiliary station including the limitation of being on the following frequencies:

220.5-225 MHz, 420-431 MHz, 433-435 MHz, 438-above MHz

If the repeater input is on one of the above frequencies, I see no reason it cannot double as being the control link. Provision would have to be made to make sure the user of such an input can hear the third party traffic at all times that it is being passed. That might mean that the phone connection is cut off during the time the user/control-op is sending. That would be a convenience in the repeater that makes it easier for the control operator to meet his legal obligations without full duplex capability.

Sorry folks, but thems the rules. Interpret them as you see fit, since in the end, that's your responsibility, and it is your license. The above is just how I interpret them for my own purposes. My autopatch control link will be on an auxiliary frequency only.

If you think the rules need to be changed, you can petition the FCC to change them. I personally feel they should be changed, but am not sure just yet exactly how. I welcome contact about this matter.

>                       Full power.                        for 2 years.

A couple of questions:

1.  Do you mean to restrict the power for ALL bands for class B or just
    for the HF bands?

2.  Why do you choose 250 watts instead of the 200 watts Novices and Techs
    now have as power limits (and everyone has on 30m)?

>Any comments??   Should I actually write this up and propose it to the FCC?
>Should I don my NOMEX underwear??

I'd have chosen 150 watts if a change was necessary.  That makes for a nice
round ratio of 1:10 for power between A and B.

The NOMEX might be a reasonable precaution.  There are a lot of people
out there that want to hold on to their (H)igh (A)am (M)ighty status.  :-)

RTTY DX Notes 1of3 11/9/90

RTTY DX Notes for week ending 9th November 1990
BID: $RTDX1109
Part 1 of 3.

Last week I made mention about reading books to see what AMTOR was all about. There are several good books to read. There is one written by G3PLX, Peter Martinez, which explains the protocol between stations, and some of the commands. But for the actual working of the AMTOR system it is suggested that you read and study CCIR Recommendation 476-4. That tells you nothing about commands (each system has its own series of commands) but it will tell you how the AMTOR system works in detail. Its worth reading if you are not just a black box basher.

Our thanks this week go to DJ3IW, DL8AAM, I5FLN, JA1BLV, OD5NG, TG9VT, VK2EG, W2JGR, W2UP, and the Tristate DX Packet Cluster Network.
Thank you all for your assistance and news.

Part 3 of 3.

Thursday 8:

UI9ABV	14083	at	0450Z	
P29BT	14084	at	1411Z	QSL

QSL Information:

PJ2/OH2BGD will QSL via his home call.

HK0TU says to QSL via HK3DDD.

UC2OCJ collects his cards from Box 68, Gomel, Byelorussia 246027 USSR.

J73WA is Wayne Abraham, 1430 Rodney St., Portsmouth, Commonwealth Of Dominica, West Indies.

CN15AMV will QSL via Box 299, Rabat, Morocco.

Notes of Interest:

Banaba T33 should be active now, but nothing heard so far.

Juan Fernandez. CE0ZZZ should be active this week. QSL via CE3BFZ.

You can stop holding your breath: cards for YV0AA have started to appear. One wonders how long before other cards for the April period of operation will take to appear?

Angola. There are some rumors around that there may be activity from this area in the near future. We hope for the best.

3W3RR states that he hopes to operate from Spratley in December for a ten day period. But, he needs donations, which may be sent to NT2X, Ed Kritsky, Box 300715, Brooklyn, NY 11230 USA. In case of cancellation all donations will be refunded.

CN15AMV was operating from the capital of Western Sahara. Does this count as Western Sahara (SO) or CN8? If it counts as CN Morocco then we have two countries with the same QTH? Or something.

GL DE DX1 (VK2SG).

Written by VK2SG. Relayed via packet by Tad, KT7H @ N7HFZ.WA.USA.NA.

The ARRL Letter Volume 9 Number 22 November 2, 1990 - Part 1 of 4

LEAGUE PROTESTS COMMENT DEADLINE TO FCC

The ARRL has filed a an "Application for Review" with the FCC, requesting the commissioners overrule a staff decision. The League seeks more time to respond to proposals for new Morse code testing procedures for disabled persons.

This is the latest episode in PR Docket 90-356, which began with a public announcement by the FCC in early August and culminated in the FCC's denial, on Sept. 28, of the League's request for more time--until Nov. 15--to comment.

The League has from the very beginning stressed that, since new procedures were implemented for disabled applicants immediately upon the August announcement--and some other accommodations have been in effect for years--there is no urgency in formalizing them through rule-making.

The League maintains that because of the unusually short time frame between public announcement and comment deadline, ARRL found it nearly impossible to study the proposal, seek comment from individual examiners to gain from their experience, and formulate comments on the proposal.

Because of "the significance of the proposal to the Amateur Radio Service," the Application said, the League felt additional comment time was a necessity, not a luxury.

The League pointed out that the main sources of information available to amateurs--the monthly magazines--simply were unable to publicize the matter in time for examiners and the disabled themselves to comment.

Furthermore, the Commission broke with tradition in this matter. In the past, proposals likely to have strong impact on the Amateur Service always have been afforded a reasonable comment period.

"This proceeding is not merely a simple matter of attempting to accommodate the needs of the handicapped by waiving an inconsequential examination element," The Application for Review said. "It is, rather, a reversal of stated policy, and an action which stands to jeopardize the integrity of the volunteer amateur radio examination program."

The Application went on to again point out that procedures already in place for accommodating disabilities are producing applications for waivers, some of them frivilous. The list of disabilities (from the Disabled Americans Act of 1990) is overly broad, many of the disabilities listed having no bearing on someone's ability to use Morse.

As a result of the August announcement, one waiver application--with a letter from an optometrist--sought relief from the Morse requirement for an applicant with a vision problem. A problem correctable with eyeglasses.

The League also noted again that the FCC, in 1982, held that "(s)electing a particular group of license applications for favorable treatment in terms of less stringent amateur operator requirements would not be sound licensing policy...if such a policy were instituted, the Commission ultimately could find itself in the untenable position of deciding which applicants actually qualified for telegraphy exemptions and which did not. Commission personnel clearly are not trained to make such judgments..."

And so it is that the FCC now proposes to turn what, in 1982, was "not sound licensing policy" into a rule eight years later.

The Application for Review asks for an additional 48 days for comments to be accepted by the FCC.

RINALDO IN EUROPE FOR WARC

The technical foundations for WARC-92 are being laid at a series of meetings under the auspices of the International Radio Consultative Committee (CCIR). The CCIR is the part of the ITU structure responsible for making recommendations on technical and operating matters relating to radio communication. The meetings ultimately will result in a concise reference document that will be used as a basis for decision making at WARC-92.

A CCIR Joint Interim Working Party meeting was held in Geneva Oct. 22-25 to draft the section of the report dealing with the compatibility of various high-frequency (below 30 MHz) radio services. This section of the report is important to amateurs because of the different regional allocations to the broadcasting and amateur services at 7 MHz, and because broadcasting expansion may result in increased sharing of HF spectrum between other services.

ARRL Technical Development Manager Paul Rinaldo, W4RI, attended the meeting as a member of the U.S. delegation. Participating as an observer for the International Amateur Radio Union was IARU Region 1 Vice Chairman Wojceich Nietyksza, SP5FM.

with the mobile and mobile-satellite services and their present and Another important CCIR Interim Working Party meeting, this one dealing potential sharing partners (including the amateur and amateur-satellite observers) will open in Helsinki Nov. 12. Rinaldo is on the U.S. delegation to this meeting; representing IARU will be Capt. Charles Dorian, W3JPT.

The outputs of these and other CCIR Interim Working Parties will be fed, for final review and approval, to a special "JIWP WARC-92," which is scheduled to meet in Geneva in March 1991. The objective of ARRL and IARU participation in the work of the CCIR is to ensure that the report adopted at that meeting adequately reflects the continuing spectrum needs of the amateur and amateur-satellite services.

OFFERS HOPE TO DISABLED

People with severe physical disabilities are now able to communicate using a Morse code-based system developed at the State University of New York at Buffalo (UB). People unable to speak or to move their limbs can communicate with an Apple computer by sending CW to the computer--by moving their heads from side to side, closing switches--according to UB Today, a publication of the university.

Develoed by S. David Farr, associate dean of the school's graduate school of education and director of its Learning Technologies Laboratories, the system's CW input to the computer replaces the computer mouse. Farr initiated the project, called Morse Writer, in 1985, for Matthew Stein, now 13, who has had cerebral palsy since birth and is a severely-involved paraplegic, according to UB Today.

Matthew uses the system in two ways. "Message mode" is a form of shorthand in which, for example, sending the letter "z" produces "thank you," and "o" means "hello." Used in free-typing mode the Apple on the computer screen, produce printouts, and speak via a voice synthesizer.

MacIntosh becomes a word processor. Matthew's system can display type Many people have seen the physicist Stephen Hawking, the author of "A Brief History of Time," use a similar device. Hawking, who suffers from Lou Gehrig's disease and is unable to speak, types commands into a computer, which activates a voice synthesizeb.

Closer to home was the late Cliff Corne, K9EAB, who for years was confined to an iron lung and sent CW using his mouth to operate a keyer paddle. This was in the 1960s, before the microcomputer.

Today, sophisticated hams using computers and digital voice keyers are able to operate on voice modes without ever speaking a word.

AMATEUR RANKS CONTINUE GROWTH

Both new Amateur Radio licensees and license upgrades showed a healthy increase in the past year. FCC statistics for the fiscal year ended Oct. 1 have been released (statistics actually were compiled through Sept. 25) and are shown below along with the five-year trend.

	1990	1989	1988	1987	1986	1985
New	26,134	23,065	21,080	24,338	20,979	17,373
Upgrades	29,699	26,789	26,342	23,814	22,228	16,184

The total number of amateur operator licensees grew 6.1 per cent, from 464,800 to 493,292. Here is the breakdown by license class:

Total	
Extra	52,847
Advanced	104,365
General	119,158
Technician	125,217
Novice	91,705
Total	493,292

PANELIST SCORES FCC METHODS

FCC Commissioner Ervin Duggan has called for sweeping reforms to disperse the "concentrated" power of the FCC chairman and restore "truly collegial decision making" at the agency.

The Commission has evolved into "a top-down, one-option process of deliberation, a frustrating and often stultifying parody of collegiality," Duggan told a meeting of the Federal Communications Bar Association.

Duggan's recommendations include:

[] Reform of the post-Watergate "Sunshine Act," which prohibits more than two commissioners from meeting in private.

[] Restore independence to bureau chiefs.

[] Require bureaus and offices to work with all commissioners, not just with the chairman.

[] And, encourage staff in other bureaus or offices to present "associate or companion" items in proceedings to develop alternative solutions.

The other three FCC commissioners, Sherrie Marshall, Andrew Barrett, and James Quello, who also attended the meeting, were generally supportive of Duggan's ideas. Quello, however, noted that "It's Congress, not the FCBA," that will have to make any changes in the way the FCC conducts its business.

HARVARD CLUB HOSTS SOVIETS

Last May nine members of the Harvard Wireless Club (W1AF) travelled 6,000 miles to Leningrad and operated for 10 days from club stations UZ1AWT and UZ1AWX. Working alongside Soviet operators under the call sign US1A, the group made some 21,000 contacts and many new Amateur Radio friends. The event was hosted by the Leningrad Institute of Aircraft Instrumentation.

Immediately upon his return W1AF trustee Mike Manafo, K3UOC, resumed planning for a reciprocal visit by the Soviet club members. "An event like this is not to be taken lightly," Manafo said. "It was six months of very hard work.

"This also was probably the most significant happening of my life," he added.

In mid-October seven Leningraders arrived in Boston for Part Two of this exchange. Although the long-awaited U.S.-USSR reciprocal operating agreement failed to materialize, the Soviets were able to participate in Amateur Radio at W1AF under third- party rules.

On Oct. 23 the Soviet club members visited ARRL Headquarters, with hosts K3UOC and NZ1W. Following a tour of the lab, the QSL Bureau ("Box 88, Newington"), and W1AW ("It's a pileup!" one of the Soviets exclaimed), the group exchanged mememtos with ARRL Executive Vice President Dave Sumner, K1ZZ, and W1AW manager Eddy Pollock, W6LC.

Back in Cambridge, five of the Soviet club members battled the language barrier to become U.S.-licensed hams. They were: Dmitry Samrin, UA1CFL (Novice); Vladimir Alexandrov, UA1AIU (Novice); Sergei Hrapenok, UA1ABR Ivliev, UA1ALZ (Advanced).

(Technician); Victor Stroganov, UV1AA (Technician); and Alexandr
The Leningraders' U.S. visit coincided with a rebuilding program at the HWC station--which now includes new HF gear and antennas donated by several Harvard alumni--and with the *CQ* Worldwide SSB DX Contest. The Soviets joined eight U.S. operators for a multi-single contest entry.

"The computerized operation, including both contest software and the PacketCluster spotting network, was pretty daunting for the Russians," Manafo said. (It's daunting for *anybody* using it for the first time--ed). "But they loved it," Manafo said. The W1AF operation netted three-and-a-half million points.

Following the contest, the group visited several expatriate Leningraders in the New York City area, and were scheduled to return to the Soviet Union Nov. 1.

OHIO AMATEUR BATTLES ORDINANCE

Another municipality has found federal law to be on the side of Amateur Radio operators. Rocky River, Ohio attempted to apply three separate ordinances to keep the 30-foot tower of James D. MacMillan, WA8ZHN, on the ground, after his application was rejected by both the building commissioner and the board of zoning appeals.

The town held that the proposed tower would decrease real estate values, was too close to the side lot line, and that certain technical information was missing from MacMillan's application.

According to MacMillan, "the problem with the zoning code is not the 60 foot height limit, but (rather) a provision that the neighbors have a right to protest because they don't like the tower for whatever reason."

This ordinance represented "discrimination under the color of law," MacMillan said. The city "can arbitrarily discriminate based on the whims of the neighbors."

In overturning the town's rejection of MacMillan's application, Judge Frank J. Battisti held that the city did not apply the zoning laws in such a way as to provide for reasonable accommodation of amateur communications. The court said there was no violation of the height ordinance with respect to the distance from the side lot line because the city has interpreted it incorrectly. The federal court also refused the city's request to relinquish jurisdiction to the state courts.

MacMillan was represented by ARRL Volunteer Counsel Robert M. Winston, W2THU, who has won several other tower cases in the Cleveland area. "We have won the battle, but not yet the war," Winston said, because the
a tower."

BRIEFS

court has not yet ordered that Rocky River issue a permit to construct
[] A special effort to reduce a sizable backlog in DXCC submissions has begun at HQ. Coordinated by Business Manager Barry Shelley, staff throughout the building are helping with routine processing of applications.

Ganging up to produce the backlog were the the addition of several new DXCC countries, the peak of the solar cycle, and new band endorsements for Amateur Radio's most popular award. For more background read "It Seems to Us," in November *QST*.

[] At The Front: The New Bern (NC) Amateur Radio Club will sponsor a Novice licensing class using ARRL materials. Not news? The news is the class will be conducted in Saudi Arabia, under the direction of U.S. Marine Mark Bitterlich, WA3JPY. Bitterlich, 37, has asked the club to send the study materials "to relieve the boredom and inactivity of those serving in 'the sand pile.'" The club's next step is to get accreditation for a volunteer examiner team.

[] The Queen Mary is back on the air. After a year of inactivity the ship's Amateur Radio station--W6RO, the club call sign of the Associated Radio Amateurs of Long Beach--once again provides a look at the hobby to visitors (as well as an opportunity to operate for visiting hams). Nate Brightman, K6OSC, is radio room manager.

[] The Radio Amateur Satellite Corporation has honored two HQ staff members. At their Oct. 20 banquet AMSAT recognized laboratory supervisor Jon Bloom, KE3Z, and educational activities coordinator Rosalie White, WA1STO, with plaques for their work with SAREX. Bloom was the original HQ liaison for the SAREX working group; White has been a member of the group since early 1989. Some 25 AMSAT volunteers also received plaques.

[] Richard A. Burton, formerly WB6JAC, has been fined $2,000 and placed on probation for 12 months, for transmitting without a license through a Los Angeles 2-meter repeater. Burton was convicted of the charge July 20 in federal court. In the early 1980s Burton's license was revoked for Part 97 violations. After his appeals were turned down he was ordered off the air, but he continued to operate. Following appeals Burton was jailed for seven months and then served five years on probation.

[] Nominations are solicited for the 1990 ARRL Herb S. Brier Instructor of the Year awards and should be sent to your Section Manager by January 31, 1991. These awards, recognizing classroom instruction in Amateur radio by both professionals and volunteers, went (in 1989) to Lyle Aufranc, AA6DJ, and Gerald Kasselmann, KD4QA.

According to the Associated Press, mysterious lights observed by
thousands of people in the night sky over France on the evening of
5 November came from pieces of a Soviet rocket re-entering the
atmosphere. Quoting French and U.S. space agencies, AP stated that
the rocket had been used to launch a telecommunications satellite on
3 October.

I agree wholeheartedly with Tad. I had the same thoughts but kept my fingers from the keyboard in order to prevent the inevitable flame war from the usual quarters.

Brian Kantor gives a good nutshell intro to DSP. The method he describes for filtering is only one of perhaps three different ways of doing it in DSP; I think it's called "transform filtering".

Two other ways that are actually much more used in practice are called "Infinite Impulse Response" (IIR) and "Finite Impulse Response" (FIR). The names come from the fact that you can send an impulse (a "spike") into an IIR filter and have the effects reverberate in the output forever, while an FIR filter will always settle down if you wait long enough.

The difference is that IIR filters have internal feedback, while FIR filters do not. IIR filters consist of stages of registers and multiply/add operations that often closely resemble in structure what you would build in analog hardware. Performance is very similar too, except that you don't have the component tolerance problems you usually have with analog filters.

An FIR filter consists of a long shift register that is clocked at the "sample rate" (the rate at which you feed new input signal voltage measurements into the system). (Actually, since each sample is typically 8 or 16 bits, you need 8 or 16 shift registers in parallel, one for each bit of the sample.) A sampling clock pulse causes the value in each register stage to move down one stage toward the end; when a sample "drops off" the end it is discarded. After each clock pulse, all of the register stages are read out in parallel. Each value is multiplied by a constant unique to that stage, and the results of these multiplies are all added together. This becomes the filter output for this clock pulse. When the clock ticks, a new sample goes in the front, the oldest sample is clocked out into the bit bucket, and the multiply/sum operations are done all over again.

Here's what an FIR filter of length 5 would look like. If the samples are 8 bits wide, then each stage of the shift register has to hold one

8-bit sample in parallel.

```
              _____________________
samples in -->| 1 | 2 | 3 | 4 | 5 |---> bit bucket
              ---------------------
                |   |   |   |   |
                x   x   x   x   x
                K1  K2  K3  K4  K5
                |   |   |   |   |
                -----------------
                |     sum       | ----> output
                -----------------
```

You can see why this is called a "finite impulse response" filter. No matter what constants you use, the effect of any input signal will not continue past the point where it "drops off" the end of the shift register. But by choosing an appropriate constant for each stage in the chain, you can make an impulse at the input produce any waveform you want at the output, as long as the chain of registers is long enough.

Being able to produce an arbitrarily-shaped response to an impulse input is equivalent to being able to produce any filter shape (in frequency) that you want; again, you are limited only by the length of the shift register. In a long register, you have a LOT of "tweaks" to play with, so you can produce some pretty bizarre filters if you like.

Filter lengths of 256 stages are common in real systems. Programs exist that will determine all those constants for you. You tell them the (arbitrary) frequency response curve you want, along with various constraints on the system (e.g., the maximum length of the shift register, the desired tolerance in meeting your response function, etc). Out comes a list of constants plus a plot of what the actual response will look like. (The longer the shift register, the closer this will be to your desired response. Some filters, e.g., perfect lowpass, cannot be realized without an infinite number of stages. This is not a limitation of DSP - you can't build a perfect analog lowpass filter without an infinite number of components either.)

The most useful FIR filters have symmetrical constants; in my example, K1 = K5 and K2 = K4. This produces filters with flat "group delay" (aka "linear phase"). That means that all frequency components in the input will pass through the filter with the same time delay (if they make it through at all, that is). This feature is an extremely useful one in modems, but it is VERY hard to provide economically in either analog hardware or IIR DSP. This is perhaps the main reason why FIR filters are so popular, despite their needing many more shift register stages and arithmetic operations than IIR filters with the same frequency response curves.

Now that you understand how a FIR filter operates you can see why regular CPUs are usually inadequate to build serious filters, and why the "multiply/accumulate" instruction in a DSP chip is always so heavily optimized: the FIR structure is simple, but computationally very demanding.

The multiply/accumulate instruction takes two values from memory, multiplies them together, and adds the result to the accumulator. Many chips do it in one or two CPU clock cycles. (The shift register is usually implemented in memory. Instead of actually copying the data on each clock pulse, you create a circular buffer and just increment some registers to keep track of where the beginning and end are.)

As these chips get faster, you can build longer FIR filters (or run shorter filters at higher sample rates) and do more complex systems on a single chip. It is now no big deal to do a complete 9600 bps phone modem, with multiple FIR filters, phase locked loops, data descramblers, etc, all implemented as sections of one big program that a single DSP chip completely executes once per sample.

Derek,

How does knowing CW help me converse with people who don't speak
English, assuming, of course, that I can't speak *their* native
language either?

English is a natural language. CW (or more precisely, the
International Morse Code) is a *CHARACTER SET*, nothing more. Knowing
a character set does not mean you know the natural language that uses
it, as anyone who has studied Russian (or Japanese) can tell you.

Oh, you're referring to "conversations" like "FB OM UR 599 HR CUL 73 QRZ..."?
Never mind...

Dana,

You're quite right - in theory it shouldn't matter which sideband you use for packet. In practice, however, sometimes it can make a difference because of the non-symmetric response (amplitude or phase) of the crystal filter in your radio. In this case, one sideband or the other may give better results. N4HY and I have both noticed that LSB works better than USB when receiving PSK from the Microsats on our IC-471s.

>>fifty years.

>
>I don't think you do, either.

No, but I know it is NOT going to be like it was in the past...
...if there is anything at all.

>"Lack of growth" is due to a large variety of things, chief of which is the TV, "Nintendo" games, and computers. I don't buy your argument that the need to copy Morse at 5 WPM is the direct cause.

In such a world, do you think requiring someone to do something that is clearly (to them, not to many hams) irrelevant is going to cut through it?

Most kids today COULD learn Morse Code, and probably better than anyone. But why don't they? Because we have failed to impress them with anything that it is useful for. Mere challenge for the sake of challenge is not why most existing hams learned Morse Code.

>If a "stick to tradition" attitude is a knife in the heart of amateur radio now, why was it not so in earlier years? Why, oh why, must we be constantly be propagandized with the idea that tradition is bad? Progress has been, and will continue to be, made while holding to traditions.

Things were different back then. When ham radio first got started, there was no tradition to look back to, so the issue just never came up. Code was the only way to operate, and if you didn't learn it, there just wasn't anything to do. It was required for a license simply because you just had to learn it anyway.

But things change. If people themselves want to live in the past, let them. But let ham radio go free to find its niche in the future. Don't tie it down to the past.

>Why do I keep spinning the dials up to the VHF and UHF bands and hear people who make me feel bad instead of feeling profoundly proud? There are bad attitudes and rotten apples all over, that's why; and I certainly can't see a no-code license improving THAT.

I'm not saying it will. But a code test hasn't improved it. It's bad now. The question is if a code test is preventing it from getting worse. This is something we cannot know the answer to (many of us believe something).

These problems are the result of society and government. People have so little respect for government these days. It's rather obvious when the FCC cannot afford to enforce existing laws. And now we have this crazy drug war that is doomed to failure. Government has no respect any more.

>The point is, that none of the foregoing hyperbole is selling no-code, (or, for that matter, pro-code) and few people seriously believe that no-code is the panacea that will rescue amateur radio from (moot) death.

No, "no code" won't save ham radio. Marketing the hobby will, but we can't do that until we are out from under the code requirement that is stiffling the product.

You can't sell a product people won't buy.
Once you have the product, then you have to SELL SELL SELL!

On a recent trip to Florida I noticed an interesting time signal
at several spots across the broadcast band.

It had ticks at one second intervals and a tone at the exact minite,
followed by a high pitched RR in code about 2 seconds later.

All through this in Spanish a man and woman rambel on.

The signals were quite strong with the minuite beep sometimes copyable
over the Miami 740kHz news station even in Miami Beach. The other two
chanells were around 590 KHz and 950 kHz (?? I seem to have lost my notes)
The voice program seemed identical between all 3.

Any one know who runs this service?

What the format is ? ie how is the time actually stated (ascii on the RR?)
What the commintators were rambeling about (mabey advertising?)

I probably should have had someone who spoke Spanish listen while I was down there
but didn't get a chance, and I do not seem to be able to copy it up here.

My question is about the odd order that channel numbers are displayed
on the 2 digit LED display.

The following are sequencially displayed as the selector knob is rotated;

1 2 3 9   ---   transmitter will not key on these

o6 o7 o8 o9 10 11 12 13 14 16 18 22 24 25 26 27 28

68 69 70 71 72 78 79 84 88

The rig makes about 15 W into a dummy load on all chanels except
13 where it seems stuck at 1 W.

Any thoughts on the odd channel number spacing ?
Why ch 1 2 3 and 9 are RX only ?
Is the display operating properly?

In a few min of tunning (at 2AM :-)) I was only able to hear one
conversation on ch 18, then again there was almost no antenna !

I remember having seen several stations called "Radio Reloy" when reading
through the WRTH, all located in the Caribbean (dunno exactly where, maybe
Cuba, maybe there are several countries using the same name and/or format for
their news program).
They are described as news and talk stations, with second ticks and a signal,
identification "Radio Reloy" and time announcement on every minute.

Can't tell you more from my memory, but this should be something.

In the absence of any substantiation, I would tend to suspect your friend is
a guppie trying to sound like a shark. Details, please!!

PS -- What's the point to separate newsgroups if everyone posts in all of
them?

>>Somehow, I have trouble swallowing the argument that 5 WPM code keeps the brightest minds out of Radio. A truly disciplined mind will recognize the CW requirement for what it is ("an interesting, but irrelevant baseband modulation example"), spend the 6 hours or whatever learning it, and then get on with being brilliant.
>
>I repeat a point I made in the past. Morse is a marketing disaster.

I agree. I think we shoot ourselves in the foot, too.

Here's my modest proposal: provide (small) code-free [vsu]hf subbands. If they turn into glorified CB bands, then don't give them any more bandwidth. If they turn into real technology mills, then expand them.

>I work at an establishment that designs advanced computer networks, including hardware, software, protocols, etc. This place is lousy with EEs. Yet I have met very, very few people interested in getting started in ham radio for the first time.

I work in a similar environment. One person here has been a factor in five people getting licensed. That's ~10% of the organization.

>Sometimes people begin to get interested. Then they inevitably ask the question, "Do you still need to know the morse code?" Given that the answer here is still "yes", they immediately lose all interest. They just don't want to waste time learning an antiquarian skill as a hazing ritual.

The answer is "Morse Code is required of US amateurs by international treaty. Besides, it is so trivial to learn that that you can do it in 2 weeks by studying 1/2 hr/day." While you may acknowledge their perceptions, you don't have to agree with them. Two guys here knew they were being hazed, but then got into the challenge so much, they went for 13 WPM !

For anyone who plays Tetris, or any of those video games, Morse Code is like making it to Level 5, 13, or 20. I've watched my wife spend hours trying to hit level 10 / height 6. No difference. She could have been at 13 WPM by now.

>If you want to communicate, the Usenet is zillions of times faster and more reliable than ham radio will ever be.

Agreed. But the purpose of ham radio is not efficient communications. (Boy, am I going to get flamed for that.) The purpose is to _develop_ and _test_ efficient communications (like packet, new modulation techniques, etc).

>And I'm a CW operator, so don't give me any crap about my own lack of
>effort. I like to _use_ CW. I just don't like to _require_ it.

Then we need to create a VHF-and-up license class. But, if that happens, I want large Communicator-free subbands. If the usage patterns explode like everyone predicts, then give them more spectrum. If they behave like cretins, take away some spectrum.

Copied From Amateur Packet Radio:

```
 Msg# TSP  Size To     @ BBS  From    Date  Time Bid
14664 BN$  3080 ALL    AMSAT  DB2OS  901109 1252 02B018DK0MAV
Subject: RADIO-M1: CW-Telemetry Equations
```

de DB2OS @ DK0MAV

Info from AMSAT-U:

TELEMETRY OF "RADIO-M1"

Radio-M1 transmits Morse code (CW) and digital telemetry.

CW telemetry will start as soon as the bird separates from the launch vehicle and Radio-M1 equipment will be powered by main satellite power system.

CW Morse-Code telemetry frame consists of the registration call RS14 and 8 four-digit lines in the following format:

```
     RS14  1A 1B 1C 1D
           2A 2B 2C 2D
           3A 3B 3C 3D
           4A 4B 4C 4D
           5A 5B 5C 5D
           6A 6B 6C 6D
           7A 7B 7C 7D
           8A 8B 8C 8D
```

The 1A to 7A lines are analog telemetry data. Line 8A is calibration engineering parameter.

The first digits from 1A to 8A are system status data:
figure 6 means general operating status
figure 2 means command operating status.

The second digits from 1B to 8B (0 to 7) are numbers of line (channel).

The third and fourth digits from 1C to 8D are analog telemetry datas.

Table of meaning and decoding parameters

No of line	Parameter	Formula	Unit
0	Transponder power output	0.05N	Watt
1	Transponder PA Temperature	N	Grad. C
2	+24 V Regulated	N	Volt
3	+16 V Regulated	N	Volt
4	+9 V Regulated	N	Volt
5	+24 V Regulated	N	Volt
6	Inside Temperature	N	Grad. C
7	Service	N	*

Example:

```
        RS14
        6080    -   4 Watts       -  general
        6137    -  37 Grad. C     -  general
        6224    -  24 Volts       -  general
        6316    -  16 Volts       -  general
        6409    -   9 Volts       -  general
        2524    -  24 Volts       -  command
        2632    -  32 Grad. C     -  command
        2700    -   0             -  command
```

> of my land. I would like to place my antenna at the top of this hill.
> The horizontal distance is about 200 feet. The problem of course,
> is connecting the radio to the antenna. Cable sounds too

Maybe you could try a "passive repeater" setup. This involves your primary antenna on the hilltop, the cable to the shack, and a secondary antenna _in_ the shack. A line amplifier somewhere in between _might_ help, but you would have to find a way to power it.

This type of system is briefly described in the November, 1990 issue of Popular Communications.

DEUTSCHLAND-RUNDSPRUCH DES DARC NR. 38/90 VOM 09.11.1990

NEWINGTON:

Das Diplom-Komitee des amerikanischen Amateurfunkverbandes ARRL hat die DDR mit Wirkung vom 03.10.1990 von der DXCC-Laenderliste gestrichen. Dies meldete die Rundspruchstation W1AW am 07.11. QSL-Karten mit den Landeskennern DM und DT bzw. Y2 bis Y9 werden nur noch fuer die Zeit vom 17.09.1973 bis zum 02.10.1990 fuer die DDR anerkannt. Verbindungen ab dem 03.10.1990 zaehlen fuer Deutschland, das heisst wie DL. Die Demokratische Volksrepublik Jemen, 7O, und die Arabische Republik Jemen, 4W, sind ab 22.05.90 in der DXCC-Laenderliste gestrichen und durch ein neues Land Jemen, 7O, ersetzt. Als fruehester Termin fuer die Einreichung neuer 7O-Karten ist der 17.03.1991 festgesetzt. Damit umfasst die derzeit gueltige DXCC-Laenderliste 322 Laender.

HERNE:

Die AMSAT-NA hat die im Herbst geplanten Termine fuer die naechsten ZRO-Tests ueber den Amateurfunksatelliten OSCAR 13 bekanntgegeben. Nachfolgend sind ausser den Terminen fuer Mitteleuropa jeweils auch die Elevation und der Winkel der Miaweisung der Sa-

tellitenantennen - der sogenannte Squint-Winkel - genannt. Guenstige Bedingungen liegen vor bei grosser Elevation und geringem Squint-Winkel. Hier die Termine:
24.11.90 um 17:00 UTC, Mode B, 8 Grad Elevation, 4 Grad Squint
01.12.90 um 20:30 UTC, Mode B, 7 Grad Elevation, 8 Grad Squint
15.12.90 um 16:30 UTC, Mode B, 6 Grad Elevation, 5 Grad Squint
22.12.90 um 05:30 UTC, Mode B, 56 Grad Elevation, 24 Grad Squint
22.12.90 um 06:45 UTC, Mode L, 56 Grad Elevation, 13 Grad Squint
Die naechsten Tests erfolgen erst wieder zwischen April und Juni 1991. Es sollen dann auch mehr Tests in Mode L stattfinden. Der ZRO-Test ist ein wichtiges Hilfsmittel zur Ueberpruefung der eigenen OSCAR-Station. Die Teilnahme kann jedem OSCAR-Benutzer dringend empfohlen werden. Ziel ist das Erkennen von technischen Fehlern der Empfangsanlage und die Optimierung des OSCAR-Empfangs. Bildlich gesprochen geht es also um die Ausrottung von "Krokodilen". So nennt man volkstuemlich Stationen, die aufgrund schlechter Empfangseigenschaften ihre Sendeleistung unnoetig erhoehen. Eine ausfuehrliche Anleitung zur Teilnahme an den ZRO-Tests ist in der cq-DL 8/89, Seite 495, abgedruckt. Die Frequenzen sind 145,840 MHz fuer Mode B und 435,945 MHz fuer Mode L.

KIEL:

Der DARC-Distrikt Schleswig-Holstein betreibt auf 10,144 MHz eine Aurora-Warnbake. Sie wurde von DK4VW erbaut und dient als Indikator fuer Aurora-Bedingungen aufgrund von Empfangsbeobachtungen. Standort ist bei DK4LI noerdlich der Schlei.

Bei normalen Bedingungen wird das Rufzeichen DK0WCY dreimal hintereinander gegeben, gefolgt von einem Dauerstrich von drei Sekunden Laenge. Bei schwacher Aurora in Norddeutschland werden nach dem Rufzeichen etwa 15 kurze Striche gegeben. Eine starke Aurora wird durch einen zehn Sekunden dauernden Strich angezeigt. Es ist geplant, die Bake parallel auf einer anderen Frequenz mit wechselnden Ausbreitungsbedingungen zu betreiben.

HANNOVER:

Am 03./04.11. fand in Hannover die diesjaehrige Interradio statt. Zur Eroeffnung konnte der gastgebende Distriktsvorsitzende, Claus Otte, DL3MC, zahlreiche Ehrengaeste und Besucher begruessen.

Die Veranstaltung stand unter der Schirmherrschaft von Ministerialdirigent Peter Kahl vom Bundesministerium fuer Post und Telekommunikation. In seiner Festansprache stellte Kahl die Probleme des BMPT bei der Vergabe von Frequenzen dar. Eine Garantie fuer die Erhaltung der heutigen Amateurfunkbaender koenne zum jetzigen Zeitpunkt auf lange Sicht nicht gegeben werden. Jedoch sei der DARC aufgefordert, sich weiterhin gespraechsbereit zu zeigen.

Unter den zahlreichen Fachvortraegen dieses Tages war insbesondere der Beitrag von Dr. Lothar Wilke, Y24UK, von allgemeinem Interesse. In einem umfassenden Rueckblick zeichnete Y24UK die Entwicklung des Amateurfunks in der DDR von 1953 bis 1990 nach.

Im Ausstellungsbereich war der DARC mit einem grossflaechigen Informationszentrum vertreten. Am Stand des Jugend- und Ausbildungsreferats beschaeftigten sich zahlreiche, zum Teil sehr junge Interessenten mit dem Bohren und Bestuecken von Platinen. Ein besonderer Anziehungspunkt war wiederum der Flohmarkt.

Am Sonntag begann die Vortragsreihe mit einer Diskussionsrunde unter dem Thema: Funkamateure fragen den Vorstand und den Amateurrats-Sprecher. Zu den Fragen der Besucher nahmen der gesamte Vorstand des DARC, der AR-Sprecher, Hans-Christian Schuett, DL9XN, und der Geschaeftsfuehrer des DARC, Bernd W. Haefner, Stellung. Die Moderation lag bei Dr. Horst Ellgering, DL9MH.

Hauptthemen waren die Interessenvertretung des DARC gegenueber der Post und der Industrie sowie die drohende Bandbeschneidung des 70-cm-Bandes und die Betrachtung dieser Problematik unter dem Blickwinkel des wirtschaftlich-oekonomischen Nutzens der betroffenen Funkdienste.

Weitere Fragen wurden zur Thematik TVI/BCI, Leistungsbeschraenkungen sowie zur Belegung des Sonderkanals S6 gestellt.

Zur Bildung eigenstaendiger Interessengruppen entstand eine laengere Diskussion. Der 1. Vorsitzende, Guenther Matz, DJ8BN, stellte fest, dass technische Innovationen wichtig seien, um weiterhin den experimentellen Aspekt des Amateurfunks unter Beweis zu stellen. Jede Abspaltung von Interessengruppen sei jedoch ein negatives Ergebnis.

Die Diskussion schloss mit der Erkenntnis, dass diese Runde ein fester Bestandteil der Interradio werden solle.

Mit ueber 11.500 Besuchern hat die Interradio erneut ihre Daseinsberechtigung bewiesen. Dabei wird in den naechsten Jahren sicherlich ein weiterer Anstieg der Besucherzahlen zu erwarten sein.

FUNKWETTERBERICHT: (06.11. von DJ2RE)

Erwartungsgemaess steigen seit Monatsanfang die Tageswerte der Sonnenfleckenzahl und der 10-cm-Strahlung wieder steil an. Nach einer Meldung von Boulder/USA wurden am 04.11. 227 bzw. 156 Einheiten erreicht und am darauffolgenden Tage 266 und 170 Einheiten. Zur gleichen Zeit war die Magnetik auffallend ruhig. Auswirkungen auf die Hoehe der F2-Grenzfrequenz, deren Maximalwerte zur Zeit um 13 MHz schwanken, sind allerdings bisher noch nicht zu erkennen.

Die positive Entwicklung der Sonnenaktivitaet wird voraussichtlich bis Mitte November anhalten. Infolgedessen werden sich im Zusammenwirken mit dem jahreszeitlichen Gang waehrend der zweiten Monatshaelfte die besten Ausbreitungsbedingungen dieses Jahres auf den hoeherfrequenten Baendern einstellen.

Das Niveau des Vorjahres wird vermutlich jedoch nicht erreicht werden, da sehr wahrscheinlich das Maximum des Zyklus 22 - mit einem gleitenden Monatsmittel der Sonnenflecken-Relativzahl von 158,1 - bereits im Juli 1989 auftrat.

Ende des DL-RS Nr. 38/90 vom 09.11.1990

Bearbeitung: DC7XJ @ DB0GR

I've been watching this newsgroup lately and hoping that someone would post mods for this new radio. I just picked one up the other day and so far, so good! The local ham radio store had one on display and they had it modified by someone else to do all the fancy things, including UHF RX to 512MHz and the AM aircraft that Kenwood talks about in their magazine ads. Unfortunately, they don't have the information about how to do this yet. One ham walked into the Kenwood Service Center here and asked them and they said, "TH-77A... That won't be out until next March or April." The ham showed it to the service guy and he couldn't believe it!

Anyway, I'm dying to take advantage of these EXTRA features ASAP, but I still haven't found anyone that knows the mods, so here I am running Pnews today. Has anyone got the answer (yet) ??

Thanks!

:) :) Most assuredly, it would be hell for those that copy 20 WPM,
those that can barely copy 5, and anyone taking the Advanced written
exam.

Real demented, Joe. Go seek professional help. :)

If you *really* gotta have a 2510 for 15 meters, maybe it's time to dust
off the Handbook section on "Transverters". Shouldn't be too tough,

given the 2510's finals are ersatz-QRP (apologies to Bill) .

I'm curious where on the license it says this. Mine doesn't say anything
like this. I got my first license in 1986 and it didn't say anything then
so I guess they changed it sometime between when yours and mine were issued.

In the movie "Young Edison", Edison saves the day by using a train
whistle to signal another train approaching a blown up bridge
that the bridge was out. It turned out that his sister was on
the other train and also knew the "code". She heard her "call",
copied the message (in her head) and told the conductor to pull
the brake line.

Come on, people, if these kids back in those pre-lightbulb
days could do morse, then why can't we today?

>to do packet radio?

Novice or Tech will do it.
Lots of packet on 2 meters. Thats available to techs, but
not Novices. Novices can get on 220 mhz, 1.2 ghz and 10 meters.
On 220 there are packet bbs' here in california. In fact the
bbs that I use is tied up alot on 2 meters but usually open
on 220. Don't know if there is much packet on 1.2ghz. On 10
meters you can run packet too. On 10 you can also run RTTY
and AMTOR. (I think this is correct.) Those modes are a blast,
especially when working DX. The novice license really is
quite useful.

>I know I can pass Novice, and probably
>Technician (but not anything with a higher code rate, *sigh*).

I know what you mean. After getting my tech I worked some
BBSs, then went for the 13wpm code so I could get on HF and
work amtor and rtty on 20 meters.

>use one effectively :-) ?

There have been DSP kits, and the chips themselves aren't that hard to wire up with a handful of glue I'm told, but most significant is that there will soon be some nice DSP-on-a-PC plug-in cards. AEA and LLGrace are promising one Real Soon Now, and so is TAPR. Each of these is (as I understand it) designed to take the audio output of your receiver and do DSP magic on it. They'll come with some programs to make them act like various kinds of modems, and I'll bet there's a nice subroutine library you can use to make you own.

What I know about DSP is only slightly more than will fit on an index card, but I gained it by going to the library and reading up on it. A pleasant afternoon spent amongst the dusty volumes of knowledge, as it were. When the kits arrive, I'll learn more.

(Warning: gross oversimplifications follow! Those of you who do this for a living just grit your teeth unless I make a real clanger.)

So what's it doing? Well, say perhaps that every 8,000 times a second you measure the voltage coming out of your microphone, then scale that amount into a number between 0 and 255. At the other end, you reverse the process and turn the number into a voltage. That's just simple Analog/Digital/Analog conversion. Your phone and CD player do more than this.

So apply a little bit of DSP cleverness to it: By applying a mathematical formula (a transform) to the stream of numbers, you can convert the numbers from being amplitude-per-unit-time to being amplitude-per-frequency. Then you throw away all the numbers representing frequencies below 300 Hz and above 3,000 Hz, apply the reverse process (an inverse transform), and you've filtered the audio to 300 to 3000 digitally. (There are other ways to do this, of course, but that one's easy to visualize.)

Now say you'd wanted to apply 6db/octave deemphasis while you were at it. All you'd have to do is divide the values in the frequency domain (that's what you got when you applied the Fourier transform) by a number that doubled every time you doubled the frequency.

Sure, it takes some pretty heavy computing - but that's what the chips do for you - it's not like you were entering the numbers into a desk calculator, after all.

Now think about this: you're trying to pick a real weak signal (say, some moonbounce packet) out of noise. Because the signal is digitally created, you know its rate (say it's 1200 baud). Well, you just sample the incoming signal at that rate (or a convenient multiple of it), and look for something that periodically recurs. The noise is essentially random, the man-made signal isn't, so you can just take everything that doesn't correlate with the right rate and pitch it. What you've got left is the proper signal. You can even do this when the noise has peaks that are greater than the desired signal, since you are not discarding them based not on strength, but on periodicity. And if the digital code has any sort of redundancy, you may even be able to restore the bits that were blasted out of existence by the noise peaks. With enough redundancy, you can accurately recover a signal that's completely inaudible to the human ear.

DSP in a nutshell? No, not even. But maybe I've whetted your curiosity?
Check out the library! Even the Handbook has some info on DSP.

I own two Diamond antennas for my personal shack use and I love them.
As a trustee for a local repeater, we considered new antenna
alternatives.  We did not choose Diamond because they would have to be
modified for repeater use.
We did not consider mechanical strength or other factors...  We did not
get that far.  The problem with the Diamond or any antenna designed for
the "normal" ham is that they do not have a significant amount of down-tilt.

Down-tilt is a term decribing the antennas radiation pattern down rather
than up.  The problem is that most repeaters are mounted on a tall
tower, hill or mountain.  If the antenna's radiation pattern does not
focus some of the energy down the hill then you could have trouble
hearing or activating the repeater when you are under this envelope.

I think this is the most common repeater design failure.

Good Luck,
Phil

The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial BBS, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space. This week's elements are provided below. The Celestial BBS may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

=========
SpaceNews
=========

MONDAY NOVEMBER 12, 1990

SpaceNews originates at KD2BD in Wall Township, New Jersey, United States.
It is published every week and is made available for unlimited distribution.

* ARIANE LAUNCH *

=================

An Ariane launch on 20-Nov-90 will carry two spacecraft manufactured by GE Astro Space in New Jersey. The two satellites are Satcom C1 for GE American Communications and Gstar 4 for GTE Spacenet. Final launch preparations are taking place. The launch window will extend from 6:15 to 9:30 PM EST.

* PACSATs ON-LINE *

===================

The Packet Bulletin Board software which has been running in 'beta test' versions on UoSAT-OSCAR-14 since July has now been loaded to AO-16. This follows a period of intense development by Jeff Ward, G0/K8KA, and Harold Price, NK6K, getting software ready for hundreds of users expected to access AO-16 and UO-14.

The programs loaded to the satellites, when combined with several ground station client programs, implement the PACSAT communications protocols proposed by Jeff and Harold in papers presented at the recent ARRL Amateur Radio Computer Networking Conference. The protocols provide a connected-mode file transfer facility called FTL0 and a standard broadcast mode for bulletins and other items of general interest.

When someone is up or downloading in connected mode you will see packets from the FTL0 server callsign: PACSAT-0 (on AO-16) or UOSAT3-12 (on UO-14). Bulletins being broadcast will have source callsigns UOSAT3-11 or PACSAT-11. These packets may contain some ASCII text, although each will begin with a short binary header.

The PACSAT protocol suite requires special groundstation software to interpret binary headers and implement protocol handshakes. Papers in the 9th ARRL Networking Conference proceedings describe the protocols in detail. Software for ground stations with IBM-PC type computers will be made available free by UoS through dial-up bulletin boards and on-line information systems.

The release of the ground station software, expected around 8 or 9 November, will mark the official opening of UO-14 and AO-16 for communications by any suitably-equipped, licensed radio amateur. With LO-19 following shortly and FO-20 already providing service, the Amateur Satellite Service will soon have a useful and interesting network of store-and-forward satellites.

* SALYUT-7 NEWS *

=================

The presently unused and long abandoned Soviet space station 'Salyut-7' is tumbling uncontrollably and is predicted to re-enter the Earth's atmosphere in mid-January. Attempts to boost the 60 metric ton structure to a higher orbit have failed. Salyut-7 should produce quite a spectacular light show if it re-enters the atmosphere away from sunlight.

Here is element set 630 for Salyut-7 as released by NASA on 08-Nov-90:

Epoch   : 90 310.56350817
Incli   : 51.5998
RAAN   : 295.9675
Eccn   : 3.895E-04
ArgPer   : 71.5486
MeanAn   : 288.6002
MeanMo   : 15.81020057
Decay   : 8.7992E-04
Orbit # : 48723

* RS-14/RUDAK-2 NEWS *

Reliable sources within the Soviet Union indicate that the launch of RS-14/RUDAK-2 is now expected to happen on or about November 24, 1990. UA3CR requests the help of radio amateurs all over the world to collect telemetry and send it via packet radio or via a SSB net to him. The first day's worth of telemetry will transmitted via a CW beacon at 20 WPM on 145.822 or on 145.948 MHz SSB and will be vitally important to ground controllers. Later, after ALL systems are working properly on the RUDAK-2 transponder, PSK/BBS/MODE B operations will begin.

Perry Scott started an interesting thread on DSP, and I wanted to throw in my two cents. By way of background, I'm a grad student in EE here at Berkeley, working in the DSP group.

Perry asked what to me seems like a crucial question for getting people to experiment with DSP: Are DSPs as easy to program as Apple II Basic? The answer to that question today is a strong "no": today's DSPs typically require programming in rather esoteric assembly languages, and require the programmer to have a good theoretical knowledge of signal processing. Although there are libraries for the various processors, the programmer ends up having to write a lot of code by hand.

That's changing, however. DSP C compilers are available today, and, while they're still not very good, they're getting better. More important, in my opinion, is the emergence of "DSP design environments". For example, our group has developed a software system called Gabriel that is a graphical, block-diagram programming language for DSP. You can design a DSP system by connecting blocks (adders, multipliers, filters, FFTs, I/O, etc.) on the screen. Once the blocks are connected, you can simulate your design on the local workstation, or you can generate assembly code for a variety of DSP chips (currently the Motorola DSP56001 and DSP96002). Gabriel comes with a large selection of pre-defined blocks, and you can add your own. Gabriel also supports block diagram hierarchy, allowing you to define new blocks in terms of connections of other, pre-existing ones, much as you can create one subroutine out of other subroutines in a conventional programming language.

While it still isn't as easy to use as Apple II Basic, it's a step in the right direction: it reduces both the amount of signal processing and assembly language knowledge you need, and is faster and easier than cranking out assembly code by hand.

Unfortunately, Gabriel is written in Lisp, and requires something like a Sparc-1 with 16 MB of memory to use. But as hardware prices fall and performance increases, it may not be that long before homebrewers are able to afford that sort of setup.

For those who missed it, the un-net happened today,and we had 5 "checkins" that I know of: John, NJ7E; Gary, KE9ZM; Mike, KB9BLY; Phil, WA4DDE; and myself (N7IKQ). I could hear every one of you folks, sorry I could only talk to John and Phil... I really MUST get that license upgrade, followed closely by a linear...

So, no promises that I'll be on next week, but don't let that stop others from "checking in" to the un-net!

(I suppose most of you were busy with the contest? Eh? Well, ok, I'll mention that I joined in long enough to get 2 people who were contesting: OK5R and Y42OK.... I hope that all of you contesters did better than I in that regard!) :-)

I believe that recent changes in Part 97 have made remote control on the repeater input legal.

HOW TO RECEIVE APT PICTURES FROM THE NOAA SATELLITES

So you have decided you want to receive the NOAA and Russian METEOR orbiters and you have a radio that receives 137.500 MHz and a computer. So now what do you do? I hope this short dissertation will steer you in the correct direction.

To display a picture from the orbiting birds you need several things. First you need to 'acquire' the satellite. This means you need the program to calculate its position at any time and determine if you can hear the signals from the 'bird'. The best place to get this program is probably AMSAT-NA an organization dedicated to AMateur SATellites. They have several very good tracking programs for the IBM and also for Commodore and Apple as well. After you have acquired the program and have it running on your computer, you then need the Keplerian Elements for the NOAA satellites. These elements as well as some tracking programs are available from the CELESTIAL RCP/M, run by TS Kelso, at 513-427-0674 (Fairborn,OH) and from the Weather Fax and Remote Imaging DATALINK BBS run by Dr. Jeff Wallach, N5ITU as bulletins for some 80 + sets of satellite data. Another bulletin also tells you to what the printed numbers correspond so you can enter them into the computer program. Use the newest elements you can find as the orbiting satellites are subject to forces which change their orbits. If you use Keplerian Elements more than 3 or 4 weeks old, your chances of hearing the bird are reduced.

Once you are tracking the birds you should hear them on your receiver. They will be on 137.62 (NOAA-11), 137.500 (NOAA-10), 137.850 (Meteor 3-2), 137.4 (Meteor 2-16), 137.3 (Meteor 2-17 and 2-18). Now comes the first thing different about NOAA orbiters. The frequency deviation of the FM transmission is about +/-18-20 kHz. This is 4 times the normal deviation of a police call and 1/3 the deviation of the FM broadcast band FM signal. If you receive the signal on the regular communications width of the scanner the light areas of the picture will be noisy and the signal will sound distorted and the picture will basically be useless. If you use the FM broadcast bandwidth (assuming your scanner will let you), the signal will be weak and there may be too much background noise to see the picture.

So what now ? Well there are two ways to fix the problem, find a receiver with the proper I.F. bandwidth filter of 50 kHz, or modify the I.F. of your scanner to about 50-80 kHz. The simplest mod which has been found to be workable is to remove the narrow communications I.F. filter and replace it with a 0.01 uFd capacitor. This provides for good Wefax pictures from GOES and pretty fair NOAA orbiter pictures. It can of course result in retuning the radio, voiding the warranty and making the squelch not work properly.

The other characteristic of the NOAA satellite transmissions is THEY

ARE WEAK. To get good pictures over a large area we have found a pre-amplifier to be essential. A GaAs-FET type can be obtained from various sources at a reasonable price but still about 50-100 dollars. You can also build one for about 25 dollars from plans for a pre-amp for the 2-meter amateur band and tune it to 137.5 easily.

Lastly, but importantly, the antenna can be of an omni directional, uniform pattern type such as a turnstile antenna similar to those used in the FM broadcast reception business but of course tuned to 137.5 MHz. Mount the pre-amp at the antenna if possible. Crooked coathangers on broomsticks have been known to work, and it is not difficult to build the antenna. Of course 2-meter beams with Az/El tracking will do the job well.

Now that you have a nice audio signal from the satellite, what happens next? The audio tone of 2400 HZ which is the carrier tone that is used to carry the picture information (video), must be detected and the video data converted from analog to digital and then displayed on the computer monitor by the software. The hardware and software to do this is available from several sources with more coming along. Several stand-alone boxes are also available that produce some form of computer output either in printed form or on the display. In addition the people on the DATALINK BBS may also have some data to share with you regarding this equipment.

One of the best sources for information is the WEATHER SATELLITE HANDBOOK available from Dr. Ralph Taggart of Michigan State University at 602 S. Jefferson, Mason, MI 48854 for $15.00. Taggart also writes the monthly WEATHERSAT column which appears in '73 Magazine. A must is THE JOURNAL OF THE ENVIRONMENTAL SALELLITE AMATEUR USERS' GROUP - JESAUG - which is published quarterly. It is available for $30.00 per year from the editor, Jeff Wallach, PO Box 117088 Carrollton, TX. 75011-7088 Back issues of the JESAUG are also available.

At the present the simplest software for the IBM is the Elmer Schweittek MULTIFAX software. A hardware kit is available from A&A Engineering which includes the video dectector circuit and A/D converter. Input to the PC is via the game port. If you want to build your own, complete documentation to build an interface circuit on an IBM PC prototyping board is available from H. Paul Shuch, N6TX, for $6.00 - FAXBOARD.

The WEPIX(tm) software and hardware is available from Encomm. It will produce pictures of 1200 lines by 800 samples per line displayed at 640 x 350 pixels in 16 shades of gray or 16 colors using an IBM PC with 640kB, EGA card and at least one 360k disk.

I remember someone asking for GOES info. This is something I got of the Datalink BBS some time back.

A Low Cost GOES VAS Imaging System for PC/XT/AT Host Systems

John L. DuBois W1HDX

One of the sources of the global cloud pictures which we see transmitted over the WEFAX channel from the GOES satellites at 1691 megahertz is the VAS instrument (Visible and infrared spin scan radiometer Atmospheric Sounder) carried on the same satellites. This instrument was called VISSR (Visible and Infrared Spin Scan Radiometer) on the earlier GOES 1,2 and 3 satellites and did not have the extended multispectral capabilities of the current imagers. We do not see the original images over WEFAX, however. They have been received, processed and retransmitted at least twice before making it to the WEFAX channel.

VAS visible light images of the full globe originate as 14560 lines, each with 15288 picture elements which provides ground resolution of about 1 kilometer. The idea of receiving these original images, in full detail before any processing, has fascinated me since first learning about them. As I will show in a series of articles, it is possible for an amateur weather satellite hobbyist to assemble equipment to receive them for about two orders of magnitude less cost than a $500,000 commercial system.

Even though the cost is within reason, building such a system is not simple and it is not practical to describe in one or two articles. Therefore my plan is to present the material in a series of modest size installments. This will not be a detailed construction guide and some of the material will be quite technical. Nevertheless,it is a project well within the capbility of an advanced amateur or engineering student and I will present sufficient information, circuits and software to allow duplication.

This first installment will cover some personal history, an explanation of the data available from the VAS imager, how this data is transmitted and the requirements for an antenna and low noise preamplifier (LNA).

In 1977 I became interested in weather pictures from space as an outgrowth of my amateur radio involvement with AMSAT ... the organization of hams who build and operate amateur communication satellites. I had earlier discovered and listened with fascination to ham conversations from OSCAR-7 and to tones on 137 mhz from NOAA-4, the polar orbit weather satellite. I could not wait to jump into both activities. Within a few months a tangle of equipment was working and I could talk through OSCAR-7 while APT watching pictures of the 20 or so minute pass of NOAA-4 over the eastern United States. These pictures, while thrilling, were also puzzling ... up to that time the only satellite weather pictures I had seen were in the newspaper and they showed a neat, centered, view of the continental United States. The NOAA-4 pictures were certainly not the source of what I had seen. Well, in due course I learned about GOES. Of course ... this was the way to get my own version of the newspaper pictures.

There was a few week delay while I figured out how to build an antenna, preamplifier and converter for 1691 megahertz. Finally everything was working and the first picture, from GOES EAST, was on the screen of a small Tektronix storage scope. Now what was wrong ??? ... there was a quarter of the earth in this picture and, although it was indeed the northeast quarter, the only part of the United States visible was part of New England and it was scrunched into a tiny region in the upper left hand corner. Oh well, what I wanted was probably in the northwest quadrant view. A few minutes later, the northwest quadrant was on the screen. @$!##&*. Now the rest of the United States was visible but it was scrunched into the upper right corner and it was barely possible to separate one state from another.... a far cry from the newspaper photos which had set me off on this pursuit !

This experience was the seed of an effort which was to occupy much of my spare hobby time over the next ten years. The next step was to learn just where the clear newspaper weather pictures of the United States were coming from and why there was little, if any, resemblence to what was coming off the WEFAX images from GOES. After hours of phone calls and questions directed all over the country, I finally obtained a good description of the GOES system and found the answer: high resolution digital image data (after a great deal of handling by NOAA) is distributed to users, such as media wire service networks, who format it for their own purposes. Images in these formats never get even close to the WEFAX network ! So .... I wasn't going to be able to get those newspaper type pictures ... or was I ? .... how about receiving the digital data directly ? Lets see what GOES is really transmitting :

A good overview of the current GOES satellites is found in the "GOES D, E, F Data Book" published by NOAA. GOES carries a wide variety of remote sensing and communications equipment. In addition to visible and multispectral infrared imaging, it monitors the earths' magnetic field, high energy particle flux in the vicinity of the satellite, and x-ray emissions from the sun. In addition a transponder system collects data from remote instrument platforms on the earth and retransmits it to central processing points. Also on board is WEFAX, actually just a facsimile picture distribution system. Any document (not necessarily related to weather, as we ocasionally see) put in front of the camera at Suitland Maryland is broadcast. In addition to all this there are several radio channels dedicated to housekeeping and navigation.

The VAS images are created, visible and infrared simultaneously, by light from the earth falling on a vertical scanning mirror. It then passes through a mirror optical system and filters which focus it on the respective visible and infrared sensors. This is a point focus on small sensors representing an individual picture element. Scanning to form the image comes, in the horizontal direction, from the spin of the spacecraft and, in the vertical direction, from stepping of the vertical scan mirror. The spin is 100 revolutions per minute or 600 milliseconds per horizontal scan. After each revolution the vertical mirror is stepped to bring the next "strip" of earth into view of the sensors. There are 1820 steps of this mirror so the whole image takes 18.2 minutes. There are multiple sensors at the focal point of the optical system so that at each sampling instant of the horizontal scan, two infrared and eight visible samples are taken. For the infrared, the optical resolution is such that these two samples represent about the same region on the earth but they are measuring different wavelengths. For the visible, however, the optics are arranged so that the eight simultaneous samples show a vertical strip of image. In this way, eight lines of the visible image are formed for each spin of the satellite.

A digital multiplexer takes the eight visible samples, the two infrared samples and various other samples of telemetry data and formats them into a digital data stream at 28 megabits per second. The data is four-phase modulated (QPSK) on a carrier at 1681.6 megahertz and transmitted to earth through a small 18 db gain parabolic antenna. This antenna is "despun" or fixed in attitude while the rest of the satellite spins under it so that it can be precisely pointed at the earth. This transmission of 28mbps QPSK data at 1681 mhz is quite difficult to receive. So difficult in fact, that it was never planned in the overall GOES mission for direct distribution users to receive it. Instead, a more "user-friendly" signal called SVISSR (Stretched VISSR) was designed into the system. This is essentialy the same data sent at a lower data rate (2.11 mbps) which greatly eases the burden on direct users. Stretched VISSR, or more correctly now, stretched VAS, is the signal which a handful of professional, government and university users around the world pick up to obtain high resolution digital image data from GOES. SVAS, then, is our objective. If we can find a way to receive and process this signal, we will have the very same data and images which are used to generate WEFAX products as well as many other images for professional weather applications.

The details of how all the image samples are formatted for transmission by SVAS will be described in next article. We must first discuss the radio signal in order to determine the equipment necessary for reception. SVAS is transmitted at 1687.1 megahertz. The data stream is modulated onto the carrier as bi-phase modulation (BPSK), 0 and 180 degrees. The data bit rate is 2.11 megabits per second. The spectrum of this kind of a signal is wide band compared to WEFAX. It consists of a broad spread of power between nulls at the carrier frequency +/- N times the bit rate. Figure 1 shows a typical SVAS spectrum. The broad peak in the middle is from the SVAS signal. Its power spectrum continues on either side of this peak in a series of nulls and additional smaller peaks which are largely hidden in the noise in this picture. (The two sharp peaks on either side of the middle are other transmissions. The one on the right is the WEFAX signal at 1691 MHZ.) There is a barely visible notch at the exact middle of the SVAS spectrum. This is the carrier frequency point but the notch confirms a theoretical property of BPSK modulated signals ... the carrier is absent. This gives BPSK a high efficiency, power is not wasted in a transmitted carrier. (The notch does not go to zero on the spectrum display because of limited resolution.) It is necessary to include at least the central "lobe", which is 4 MHZ wide here, and preferably the first two "side-lobes", which would require 8 MHZ, in the receiver bandpass order to preserve signal quality. Quality, expressed as signal to noise ratio (S/N), is precious in a SVAS system and it must be preserved at every possible point.

So we have a wide band signal at 1687.1 mhz ... how weak is it and what will be needed for a receiver? Well, we must consider the antenna and LNA before the receiver or any data processing. It will turn out that these components will make or break the whole system. We can do a few calculations, look at the requirements they produce and decide to go on or quit right there. The major problems in duplicating a SVAS system are likely to occur here.

Now it is necessary to get technical. The following equations provide the tools to determine whether the space and resources you have will allow SVAS reception. The signal to noise ratio (S/N) at the receiver input is expressed by equation 1.

$$S/N = (EIRP)*G / (K*T*B*L) \qquad 1)$$

Where: S = unmodulated signal power
EIRP = effective isotropic radiated power from GOES
G = receive antenna gain
L = path loss at channel frequency
K = Boltzman's constant
B = channel bandwidth
T = equivalent receiver input noise temperature

S/N can also be expressed as the the ratio of energy per data bit to noise density by equation 2:

$$S/N = R*Eb/B*No \qquad 2)$$

Where: R = bit rate
Eb = energy per bit
B = channel bandwidth
No = noise density

We can find published curves for a perfect demodulator which relate Eb/No to the bit error rate. The bit error rate is a better quantity than Eb/No to specify because it describes what we really care about ... data errors. So we will use these curves to get Eb/No for equation 2.

Now set equations 1 and 2 equal, eliminating S/N, to obtain G/T as equation 3. G/T describes the performance required of the system "front end" under a given set of channel and transmitter parameters for the desired bit error rate. Equation 4 converts this to decibel form. An additional term M has been added to equation 4 to account for miscelaneous losses such as feedline, polarization loss, etc.

$$G/T = (Eb*R*K*L) / (No*EIRP) \qquad 3)$$

$$G/T = Eb/No \text{ db} - EIRP \text{ dbm} - K \text{ dbm} + L \text{ db} + 10 \log R + M \text{ db} \qquad 4)$$

Typical values of these parameters for GOES VAS are:

EIRP = 55 dbm
L = 189.3 db at 1687 Mhz
K = 198.6 dbm
Eb/No = 10.6 db for Pe = 10E-6
R = 2,110,360 bits/sec --> 63.25 db
M = 3 db

We plug these numbers into equation 4, and obtain 12.5 db as the required G/T. This may be related to antenna size and LNA performance by making a few realistic assumptions:

a) Antenna noise temperature = 70 K
b) LNA gain and receiver noise temperature are adaquate for the LNA to control overall noise temperature.
c) Antenna feed efficiency = .55

Now we tabulate the results for some common antenna sizes. The "maximum" figures are the largest these quantities can be and still maintain a 10E-6 bit error rate:

Antenna Dia.	Antenna Gain	Maximum System Noise T	Maximum LNA Noise Temp.	Maximum LNA Noise Fig.
24 ft.	40 db	562 K	492 K	4.3 db
18	37	282	212	2.4
16	36	224	154	1.8
12	34	141	71	.95
10	32	89	19	.28

The "bottom line" of this table is how good the LNA must be for each antenna size. We can pick the antenna likely to get past our budget, wife, zoning board etc. and then see what is required for an LNA. There is a little, ... very little, padding in the assumptions from the M (miscellaneous) factor but this will disappear fast in connectors, cables, pointing error etc. etc. I can assure you from experience that the table is not just fancy theory. It means what it says, there will be no pictures, or very poor pictures, with a 12 foot antenna if the LNA noise figure is much worse than 1 db !

Fortunately, the television satellite receive only (TVRO) industry, although not as healthy today as it was two years ago, has provided us with a good source of antennas. It is relatively easy to obtain TVRO antennas at modest cost up to 16 feet in diameter. The LNA required for a 10 foot diameter is clearly impractical but 71 degrees, as required for a 12 foot antenna, is within reach of modest cost commercial LNAs. Practical amateur LNA designs would probably fall in the area of 154 degrees and require a 16 foot diameter. Therefore we can conclude that the necessary GOES SVAS antenna size is in the range from 12 to 16 feet diameter. We must watch out for a sneaky assumption in the table, however: the LNA gain must be high enough to control system noise figure. This means that single stage (typically 14 db gain) designs will normally not be adaquate. For example, if the LNA has a noise figure of 1 db (75 deg. K) and a gain of 14 db then when used with a downconverter which alone has a noise figure of 6 db (864 deg. K) the overall noise figure will be 1.4 db (109 deg. K). This is a degradation of 34 degrees K in noise temperature which could make the differnce between good and poor pictures with a 12 foot antenna. A minimum of two stages with about 30 db gain is required for the LNA to control the overall noise figure with most downconverters.

To summarize, you will need a 12 foot diameter dish antenna with a very good LNA (probably not home built) or a 16 foot diameter dish with an LNA which could possibly be home made. Since GOES is a geostationary satellite, any of the commercial mounts made for TVRO satellites will be quite suitable. The feed horn cannot, of course, be the same as for TVRO but that is no problem. The very same feedhorn designs we have been using for years on WEFAX are inherently wideband designs. They will work as well for for the SVAS signal at 1687 MHZ as for WEFAX at 1691 MHZ. I will give a design in the next article for such a feed horn but these designs have been published many times in the WEFAX literature. Figures 2 and 3 show my antenna system. It is a 13 foot diameter dish made by Hero Corporation in Hileah Florida. The aluminum feed horn is the design I will be presenting next time. The mount is an old azimuth-elevation type made by KLM Corporation for TVRO. It is no longer in production, but az-el is really not necessary, I simply had it on hand.

I will not be giving circuit or construction details for the LNA. It is a difficult, tricky, matter to build a LNA with a true noise figure less than 1 db at 1687 Mhz, even for professionals. It was almost impossible ten years ago, and just hard now. (This fact, by the way, is the reason most literature assumes amateurs will not be building VISSR or VAS receiving systems. Fifteen to twenty years ago when the GOES system was designed, LNAs of the quality possible now did not exist and it was absolutely necessary to use an antenna of 24 feet diameter or larger. It seemed inconceivable that amateurs would build these. Of course there is ham "EME", but that is another story.) Consequently, I would suggest that the best approach is to purchase a suitable LNA. One company, Wilmanco, (19529 Business Center Drive, Northridge California 91324) has available a model 1687LNA for about $700.00. An example of an LNA design which could be home built appears in QST, August 1984, page 65. Another example appears in VHF Communications, Volume 3-1984, pages 130-136. The latter article presents a single stage low noise LNA as well as a two stage design with higher noise. For these designs to be effective, the two separate LNA's should be cascaded ... an approach which could also be used with commercial single stage LNA's such as the Microwave Modules MMG1691. Again, however, building and sucessfuly adjusting a two stage LNA is not recommended unless you have specific experience in this area. The LNA in my system is the Wilmanco and it is mounted in a housing at the rear of the horn feed. The LNA must be mounted here. If you put more than 1 foot of coaxial cable between the antenna feed and the LNA, you will seriously degrade system noise performance and waste money spent for both the antenna and LNA.

Note Added 1 March 1989:

Since these articles were first written, the situation regarding an adaquate home built LNA has changed substantially. A very satisfactory design which can be home made without elaborate test equipment or great skill appears in the Spring 1989 volume of the JESAUG (Journal of the Environmental Satellite Amateur Users Group). This design is capable of about .6 db noise figure and simultaneous 36 db gain.

Almost any previously published design for a WEFAX feedhorn for 1691 MHZ, such as the one found in Ralph Taggarts' "Weather Satellite Handbook" can be used for VISSR since the bandwidth of these designs is at least 100 MHZ. The reason that I present another design has to do with the horn material. Previous designs, such as Taggarts', suggest using a 1 pound coffee can for the cylinder. While the dimensions of a standard coffee can are fortuitously good, the plated steel material is not unless it is carefully painted to prevent rust. If you do not repaint or if you casually add just a little, I have found them to rust badly in one to three New England winters. A warmer, more arrid, climate will allow much longer service but in case you don't live in such a locale, the aluminum design sidesteps the rust problem and helps preserve precious S/N ratio. The aluminum can needed for this design is a Zero Corporation #ZTR-81B and semi-difficult to obtain in small quantities. Anyone wishing to build this design should contact the author regarding availability of the can.

The LNA should be mounted as close as possible to the probe in the dish feed horn. This means building a weather resistant housing on the back or side of the feed horn to enclose the LNA and running no more than a foot of 50 ohm coax to the probe. A little cable here, with a few tenths of a db loss, may help the stability of a marginal LNA but any more than about half a db will be sorely missed from system S/N ratio. The LNA output, if it is a two stage design with over 25 db of gain, will be able to drive up to about 100 ft. of 50 ohm coax.

The next link in the system is the downconverter. There are a number of options here, both commercial and homebuilt.

Noise figure and gain of the downconverter, while less important than those of the LNA, cannot be neglected altogather for VISSR use. The VISSR signal is centered on 1687.1 MHZ and occupies about 6 MHZ of bandwidth. Fortunately most WEFAX downconverters are sufficiently broadband that there is no practical difference in input tuning for the VISSR signal as compared to WEFAX. A typical input bandwidth is at least 50 MHZ and this will cover both signals easily. The output frequency, however, will not be the typical 137.5 MHZ. There is no receiver in the usual sense in a VISSR system. The output of the downconverter is amplified, filtered to limit the noise bandwidth and fed to a phase detector where the data is demodulated. Therefore the choice of output frequency for the downconverter must be suitable for easy amplification, filtering and phase demodulation. There is considerable lattitude in choosing this frequency, it can range from about 10 MHZ to 100 MHZ, but a very convenient choice is 70 MHZ. This is convenient because it is used by many radar, television and digital data systems. Parts such as filters, ampilfiers and phase demodulator components are more easily obtained for 70 MHZ than for other possible choices. The downconverter must therefore produce a 70 MHZ output for 1687.1 MHZ input. For homebuilt circuits this is not a difficult design change, simply recalculating the crystal and revising the output amplifier coil or transformer to resonate at 70 MHZ, keeping in mind that the Q should be low enough to allow at least a 6 to 8 MHZ bandwidth. One caution should be noted regarding the choice of 70 MHZ, however. Television broadcast channel 4 occupies the slot between 66 MHZ and 72 MHZ with the picture carrier at 68.25 MHZ. To avoid interference from a strong channel 4, all of the wiring and chassis from the downconverter through the IF amplifier and phase demodulator should be well shielded.

Among commercial downconverters, the Microwave Modules MMK1691/xxxx is a suitable choice in the $275 price class (as of 1987). The xxxx in the model number refers to the IF output frequency. It is usually sold as MMK1691/137.5 with a 137.5 MHZ IF. One of these can be readily modified for 70 MHZ output by changing the oscillator crystal to 89.8333 MHZ, rewinding the two IF output stage coils, and retuning. It can also be ordered, at slightly higher cost, as MMK1691/70 with the modifications already made. Either way the resulting downconverter will have a conversion gain of 25 to 30 db and a noise figure of about 3 db which is fine for VISSR use.

Looking again at signal levels, with a 13 foot antenna, a feed horn similar to that described, "dead on" pointing of the antenna and polarization of the feed horn, you can expect a signal at the input to the LNA between -105 dbm and -112 dbm. The uncertainty comes from possible differences in antenna and feed efficiency, and other miscellaneous losses. With a 25 db or more gain LNA such as the Wilmanco, and 50 feet or less of good coaxial cable such as RG213, the input to the downconverter will be about -85 dbm. With a 27 db conversion gain, typical of the

MMK1691/70, the signal out will be about -58 dbm, centered on 70 MHZ.

The next block of the system will be a 70 MHZ IF amplifier to filter and bring this level from -58 dbm up to -10 dbm. There must be reserve for level adjustment so the total gain required is about 60 db. The minimum bandwidth of this amplifier is 4 MHZ at +/- 3 db. The maximum bandwidth is not critical but should be less than 10 MHZ since excess bandwidth here will degrade the system S/N ratio which we are trying to preserve or enhance in every cost effective way that we can. There are a number of ways to obtain the IF amplifier. Surplus equipment available at flea markets will include radar, television distribution, digital radio or TVRO IF strips which can be used with little or no modification. Commercial amplifiers are of course available with appropriate specifications but these can be very expensive. A third way to go is to build the amplifier yourself. At 70 MHZ, parts layout is not exceptionaly sensitive and if you have had a little experience with RF circuits then this approach is practical. Figure 5 gives a suitable design.

This is a high gain RF circuit and must be built with good RF construction practice. This means short leads, a ground plane under the parts, and good decoupling on the 12 volt power supply distribution. The AGC control will be adjusted to provide about -15 dbm output at 70 MHZ to the demodulator. The maximum gain available is about 65 db which should be sufficient for even a low gain downconverter. The bandwidth is about 12 MHZ, which is larger than necessary but the single tuned response produces a smooth low distortion phase slope at the edges.

Assuming that we now have the 70 MHZ signal at about -10 dbm, the next step is a phase demodulator. This circuit is a little tricky. The binary data has been modulated onto the carrier as BPSK, zeros are sent with the carrier phase unchanged while ones are sent with the carrier phase shifted 180 degrees or inverted. In order to build a practical phase detector it is necessary to have a replica of the exact carrier frequency, however the spectrum of the received BPSK signal has no component at the center to define this carrier frequency. An ordinary phase locked loop, for example, cannot be used since there is no carrier for it to lock onto. There are a number of circuits in the literature which have been devised to deal with this problem and all depend on some kind of nonlinear operation on the signal to recover the carrier. For example, squaring will produce a component at twice the carrier frequency which can be divided by two to yield the desired signal. For VISSR use, a good circuit choice is the Costas Loop.

The Costas Loop is a variation on a phase locked loop which compensates for the lack of carrier, or expressed in another way, it compensates for the phase reversals of the carrier. Figure 6 is a block diagram of the Costas Loop. The input signal is split into two channels and mixed (multiplied) by the local voltage controlled oscillator at zero and ninety degrees phase shift. The baseband output of the mixers is filtered by lowpass filters with a cutoff just above the data rate. These filters are the final determination of overall noise bandwidth. The two channels are then multiplied togather and the output fed as correction to the VCO. Demodulated data appears at one of the lowpass filter outputs and frequency error appears at the other. In a crude way the loop operation can be understood by thinking of the data input to the VCO multiplier as reversing the correction phase at the proper times to be in step with the carrier phase reversals and therefore fooling the VCO into behaving as in an ordinary phase locked loop. At any rate, it does work and the output from this circuit is the VISSR data stream we want, at 2.11 MBPS. Trying to examine this data stream on a scope, by the way, is an exercise in futility unless it is a storage scope. If you trigger on the transitions with a non-storage scope, sucessive lines will overlay and you will not see individual ones and zeros, just their superposition. This is commonly called an "eye" pattern and is very useful anyway in diagnosing signal quality. The degree to which the center part of the eye is clean and free of any out-of-place transitions is a measure of S/N. For sucessful VISSR pictures, the eye must be at least 80% open, hopefully more.

A detailed schematic of the Costas Loop demodulator appears in figures 7A & 7B. The only part of the circuit which requires care in layout and construction is the 70 MHZ voltage controled oscillator and amplifiers. This section should be built above a ground plane with short leads and good power supply decoupling to prevent any parasitic oscillation. The remainder of the circuit is not critical as long as reasonable rf construction practice is followed.

The lock bandwidth of the loop will depend on 70 MHZ input level and should be adjusted to about -15 dbm. The loop is tuned by observing the output on an oscilloscope while adjusting the VCO with the 10K tuning potentiometer. The loop time constant is about 1 second, so the adjustment should be made slowly. As the VCO approaches 70 MHZ, the output will show a beat frequency which will clearly lock at 2.11 MHZ. It may be necessary to tune to the other side of lock and back up as the lock character is not symmetrical around the lock point.

The raw data stream out of the demodulator contains the combined VAS data and clock which have been exclusive or multiplied togather. The quality of the signal can be judged as described above by triggering an oscilloscope on the signal transitions and adjusting sweep speed for about 2 bit times across the screen. It will be normal to see lots of jitter on the edges but the pattern should be free of noise and stray transitions in at least 80% of the middle of each eye.

The next block of the system is the bit synchronizer to separate the clock and data which have been combined into this bit stream. At this point we are recovering a bit stream in which the data and clock have been multiplied togather. This is a very simple, binary, operation done by an exclusive OR cicuit where the data is one input and the clock is the other. It is done to increase the transmission efficiency. Sending the clock on a separate channel would be wasteful since it carries very little information, only its phase and frequency. Reversing the process to separate data and clock again, however, is not so simple. The problem is that after the multiplication we don't know readily whether a particular transition belongs to the clock or the data. It is only in the longer term (many bit times) that we can be sure that there have been on average, R, clock transitions where R is the clock rate.

This fact, that on average the bit stream carries a constant clock rate, is the clue to clock recovery. In the frequency domain, if we look at the bit stream on a spectrum analyizer, there will be multiple peaks spaced at the clock rate. A straightforward idea for recovery is to feed the bit stream to a phase lock loop and see if it will synchronize to the "hidden" clock. This almost works. The problem is that except for special cases, even though the spectrum peaks are spaced at the clock rate, there are nulls at the actual clock frequency and its multiples. There are a multitude of spectrum lines for the PLL to lock on, but none at exactly the right frequency ! Fortunately the solution is easy for moderate to high signal to noise ratios. If we feed this bit stream to a nonlinear circuit of some kind (almost any kind) we will regenerate spectrum lines at the clock rate and its multiples. By filtering out the fundamental and feeding this to the PLL, we will have recovered the pure clock. The bandwidth of the PLL must be set low enough to suppress phase jitter from the "random" data transitions but this is not a critical parameter.

A suitable circuit for clock recovery appears in figure 1. The first section of this circuit is simply a filter matched closely to the spectrum of the data bit stream in order to remove noise as far as possible without cutting into the information itself. Following this is an edge detector or differentiator which forms short pulses on the edges of the filtered waveform. For a noise free signal this would produce a "spike" at each edge of bit stream. This is the nonlinear operation which regenerates the clock lines in the spectrum. The pulses are then used to synchronize a PLL running at twice the clock rate. The 2 x clock line is strongest in the regenerated spectrum and most reliable for PLL lock. The PLL frequency divided by 2 then yields the 2.11 MHZ clock we need to synchronize further operations.

In order to complete the process of deriving a separate clock and data stream we must account for the NRZ-S coding of data prior to combination with the clock. NRZ-S coding replaces the original data with a transition, either 1 to 0 or 0 to 1 depending on the original state, when the source data is a zero. If the source data is a 1 then the output stays in its original state. For example a continuous data 1 would produce no output transitions while a continuous data 0 would produce a square wave output at the bit rate. In the VAS case it is this NRZ-S coded data which has been multiplied by the clock. The HC175 and exclusive-OR gate in the circuit of figure 1 strip off this encoding and produce a clean, separated data output. Additional circuitry in figure 1 examines the data stream for coherence between the clock and provides a signal to indicate whether or not there is valid data coming out. If there is, the "BIT SYNC" light comes on. During normal operation this light will blink out during the 50 millisecond period every spin (600 milliseconds) when the VAS transmitter is turned off.

FRAME SYNCHRONIZER

Now we arrive at something of a problem in planning. The current format of VAS data is organized according to a scheme called "Mode AAA". This specifies the exact placement of telemetry data, image data, and synchronizing bits within the overall flow of data and must be used to comb out the images we want. The frame synchronizer is a very specific, dedicated design which uses the format description to arrive, finally, at individual image bytes which can be placed in an image frame buffer to display the pictures. Unfortunately, NOAA is currently in the process of revising this formatting scheme to another version called "GVAR" to be effective with the launch of the next GOES satellite sometime in late 1989 or 1990. As a result my design for the frame synchronizer, while it works fine today and can be duplicated, will only be valid until the next GOES launch. I will be revising the frame synchronizer design to work with GVAR but this won't be completed until late this year or early 1989. Consequently the remainder of this article will be more of an overview of the circuits and process than in previous sections. If any readers do want to duplicate the mode AAA circuitry I will be happy to provide the circuits and more detailed information.

Once the separated clock and data are obtained at the output of the bit synchronizer, the processing becomes entirely digital. However, the high bit rate, 2.11 MBPS, and the requirement to locate specific patterns in the data stream to identify image boundarys precludes feeding the data directly into a personal computer serial data port. Even "turbo" speed PC's would not be able to ingest this data and separate telemetry from image bytes at the required rate. Fortunately the task can be done simply in dedicated hardware and provide organized image data to the PC from memory mapped onto its own data bus.

The basic frame of stretched VAS data is organized as 12 blocks, each lasting 50 milliseconds. This entire frame, which takes 600 milliseconds, is transmitted during one revolution of the satellite spinning at 100 rpm. The beginning of each block is identified by a unique 10,032 bit pattern in the data. The frame synchronizer must identify a fragment (or all) of this pattern precisely and then use the identification time as a reference point from which to count out bits and words representing the desired images. Several methods exist for identifying this initial block synchronization word. Digital correlation by integrated circuits such as the TRW 1023 is straightforward but expensive. The method used in the present circuit designs compare the ongoing data bit stream with the output of a PN sequence generator which itself produces the synchronizing pattern. If there is a mismatch, the local generator is restarted. Eventually there will be coincidence between the two patterns and when they have run togather to the end of the sequence, a flag is set for other circuits to begin operating. The local generator is allowed to continue running because the data must be multiplied by this sequence to remove a randomizing function imposed at the transmitter.

The organization of data in the 12 blocks of each line is described in the NOAA/NESDIS publication "Operational VAS Mode AAA Format, Specification SFP 002 - Version 2.2". Each block consists of a general information header giving the block number and other details, and an information field containing image documentation and the image data itself. The frame of 12 blocks contains data for 1 line of infrared image in two different spectral bands and data for 8 consecutive lines of visible spectrum image. There are 3822 ten bit image words in the infrared blocks and 15,802 six bit image words in the visible spectrum blocks. The documentation fields of these blocks contain a wealth of information for calibration, gridding, location of the field of view, orbit parameters, and so forth. There is so much information, not to mention so many image words, that the primary design task for a low cost system is deciding what to eliminate. The principle technique for simplifying the reception hardware and lowering its cost is to select a small portion (512 bytes) of the incoming data which is adaquate for the users purposes and saving only that portion in a cache RAM. At the end of the block there is adaquate time to transfer this cache into the associated personal computer. The cache interface hardware is configurable for selection parameters, mainly the number of consequtive image words to skip, so that different geographic coverages can be achieved. By saving only every 30th image word for example, the entire width of the full globe can be displayed in a 512 byte image line. The actual resolution in this image would be quite low, of course, but when smaller geographic areas are desired, fewer image words are omitted and the resolution is approximately matched to the field of view.

The design of the cache RAM and associated timing hardware will be highly specific to the personal computer selected for data handling and display. The present frame synchronizer circuits are intended to work with the common XT class computer. This interface maps the temporary cache storage into the XT memory space and issues interrupts at the beginning and end of each data block. The beginning interrupt allows identification of the block and a decision on keeping or skipping that block. If it is to be kept, the data is transfered out of the local memory following the subsequent interrupt and directly into the image frame buffer memory for immediate display of the line. This technique avoids any requirement for extended memory on the main computer bus. Timing parameters are set up through several I/O ports on the interface. In addition to image data, the general information telemetry available in the IR blocks 1 and 2 is extracted, displayed and updated on the XT computer screen once per line.

High speed operation of the computer is not a prerequisite, my system operates at the lowest common clock speed, 4.7 MHZ, and adaquate time is available for collecting 512 data bytes per image line and transfering them to the display memory.

FRAME BUFFER

As in the choice of computer, the choice of a frame buffer for video image display is wide. The conventional CGA and EGA display cards are not suitable for the purpose because their resolution and grey scale are too restricted for satisfactory VAS images. Some of the recent VGA displays will provide 640 pixels x 480 lines at 256 colors/grey shades which is adaquate for some uses. A more satisfactory solution, still at moderate cost, is to use an "image processing" type frame buffer card available from several manufacturers for both XT and AT class computers.
The minimum configuration of these buffers is 512 pixels x 512 lines at 256 colors/grey shades and a typical example is the AT&T TARGA model M8 in the $2000 price class. This is entirely satisfactory for monochrome VAS image display and allows experimentation with color representation of albedo.

The final consideration in the low cost system assembled around the XT or similar personal computer is longer term storage of the images. The technique described stores the image in the local memory of the frame buffer while it is viewed. If it is to be saved it can be transfered out of the frame buffer onto fixed disk or floppy disk. One 512 x 512 image will require 225K of storage space but this can be reduced by any of the popular "archive" data compression programs to about 150K.

I remember someone asking for GOES info. This is something I got of the Datalink BBS some time back.

A Low Cost GOES VAS Imaging System for PC/XT/AT Host Systems

John L. DuBois W1HDX

One of the sources of the global cloud pictures which we see transmitted over the WEFAX channel from the GOES satellites at 1691 megahertz is the VAS instrument (Visible and infrared spin scan radiometer Atmospheric Sounder) carried on the same satellites. This instrument was called VISSR (Visible and Infrared Spin Scan Radiometer) on the earlier GOES 1,2 and 3 satellites and did not have the extended multispectral capabilities of the current imagers. We do not see the original images over WEFAX, however. They have been received, processed and retransmitted at least twice before making it to the WEFAX channel.

VAS visible light images of the full globe originate as 14560 lines, each with 15288 picture elements which provides ground resolution of about 1 kilometer. The idea of receiving these original images, in full detail before any processing, has fascinated me since first learning about them. As I will show in a series of articles, it is possible for an amateur weather satellite hobbyist to assemble equipment to receive them for about two orders of magnitude less cost than a $500,000 commercial system.

Even though the cost is within reason, building such a system is not simple and it is not practical to describe in one or two articles. Therefore my plan is to present the material in a series of modest size installments. This will not be a detailed construction guide and some of the material will be quite technical. Nevertheless,it is a project well within the capbility of an advanced amateur or engineering student and I will present sufficient information, circuits and software to allow duplication.

This first installment will cover some personal history, an explanation of the data available from the VAS imager, how this data is transmitted and the requirements for an antenna and low noise preamplifier (LNA).

In 1977 I became interested in weather pictures from space as an outgrowth of my amateur radio involvement with AMSAT ... the organization of hams who build and operate amateur communication satellites. I had earlier discovered and listened with fascination to ham conversations from OSCAR-7 and to tones on 137 mhz from NOAA-4, the polar orbit weather satellite. I could not wait to jump into both activities. Within a few months a tangle of equipment was working and I could talk through OSCAR-7 while APT watching pictures of the 20 or so minute pass of NOAA-4 over the eastern United States. These pictures, while thrilling, were also puzzling ... up to that time the only satellite weather pictures I had seen were in the newspaper and they showed a neat, centered, view of the continental United States. The NOAA-4 pictures were certainly not the source of what I had seen. Well, in due course I learned about GOES. Of course ... this was the way to get my own version of the newspaper pictures.

There was a few week delay while I figured out how to build an antenna, preamplifier and converter for 1691 megahertz. Finally everything was working and the first picture, from GOES EAST, was on the screen of a small Tektronix storage scope. Now what was wrong ??? ... there was a quarter of the earth in this picture and, although it was indeed the northeast quarter, the only part of the United States visible was part of New England and it was scrunched into a tiny region in the upper left hand corner. Oh well, what I wanted was probably in the northwest quadrant view. A few minutes later, the northwest quadrant was on the screen. @$!##&*. Now the rest of the United States was visible but it was scrunched into the upper right corner and it was barely possible to separate one state from another.... a far cry from the newspaper photos which had set me off on this pursuit !

This experience was the seed of an effort which was to occupy much of my spare hobby time over the next ten years. The next step was to learn just where the clear newspaper weather pictures of the United States were coming from and why there was little, if any, resemblence to what was coming off the WEFAX images from GOES. After hours of phone calls and questions directed all over the country, I finally obtained a good description of the GOES system and found the answer: high resolution digital image data (after a great deal of handling by NOAA) is distributed to users, such as media wire service networks, who format it for their own purposes. Images in these formats never get even close to the WEFAX network ! So .... I wasn't going to be able to get those newspaper type pictures ... or was I ? .... how about receiving the digital data directly ? Lets see what GOES is really transmitting :

A good overview of the current GOES satellites is found in the "GOES D, E, F Data Book" published by NOAA. GOES carries a wide variety of remote sensing and communications equipment. In addition to visible and multispectral infrared imaging, it monitors the earths' magnetic field, high energy particle flux in the vicinity of the satellite, and x-ray emissions from the sun. In addition a transponder system collects data from remote instrument platforms on the earth and retransmits it to central processing points. Also on board is WEFAX, actually just a facsimile picture distribution system. Any document (not necessarily related to weather, as we ocasionally see) put in front of the camera at Suitland Maryland is broadcast. In addition to all this there are several radio channels dedicated to housekeeping and navigation.

The VAS images are created, visible and infrared simultaneously, by light from the earth falling on a vertical scanning mirror. It then passes through a mirror optical system and filters which focus it on the respective visible and infrared sensors. This is a point focus on small sensors representing an individual picture element. Scanning to form the image comes, in the horizontal direction, from the spin of the spacecraft and, in the vertical direction, from stepping of the vertical scan mirror. The spin is 100 revolutions per minute or 600 milliseconds per horizontal scan. After each revolution the vertical mirror is stepped to bring the next "strip" of earth into view of the sensors. There are 1820 steps of this mirror so the whole image takes 18.2 minutes. There are multiple sensors at the focal point of the optical system so that at each sampling instant of the horizontal scan, two infrared and eight visible samples are taken. For the infrared, the optical resolution is such that these two samples represent about the same region on the earth but they are measuring different wavelengths. For the visible, however, the optics are arranged so that the eight simultaneous samples show a vertical strip of image. In this way, eight lines of the visible image are formed for each spin of the satellite.

A digital multiplexer takes the eight visible samples, the two infrared samples and various other samples of telemetry data and formats them into a digital data stream at 28 megabits per second. The data is four-phase modulated (QPSK) on a carrier at 1681.6 megahertz and transmitted to earth through a small 18 db gain parabolic antenna. This antenna is "despun" or fixed in attitude while the rest of the satellite spins under it so that it can be precisely pointed at the earth. This transmission of 28mbps QPSK data at 1681 mhz is quite difficult to receive. So difficult in fact, that it was never planned in the overall GOES mission for direct distribution users to receive it. Instead, a more "user-friendly" signal called SVISSR (Stretched VISSR) was designed into the system. This is essentialy the same data sent at a lower data rate (2.11 mbps) which greatly eases the burden on direct users. Stretched VISSR, or more correctly now, stretched VAS, is the signal which a handful of professional, government and university users around the world pick up to obtain high resolution digital image data from GOES. SVAS, then, is our objective. If we can find a way to receive and process this signal, we will have the very same data and images which are used to generate WEFAX products as well as many other images for professional weather applications.

The details of how all the image samples are formatted for transmission by SVAS will be described in next article. We must first discuss the radio signal in order to determine the equipment necessary for reception. SVAS is transmitted at 1687.1 megahertz. The data stream is modulated onto the carrier as bi-phase modulation (BPSK), 0 and 180 degrees. The data bit rate is 2.11 megabits per second. The spectrum of this kind of a signal is wide band compared to WEFAX. It consists of a broad spread of power between nulls at the carrier frequency +/- N times the bit rate. Figure 1 shows a typical SVAS spectrum. The broad peak in the middle is from the SVAS signal. Its power spectrum continues on either side of this peak in a series of nulls and additional smaller peaks which are largely hidden in the noise in this picture. (The two sharp peaks on either side of the middle are other transmissions. The one on the right is the WEFAX signal at 1691 MHZ.) There is a barely visible notch at the exact middle of the SVAS spectrum. This is the carrier frequency point but the notch confirms a theoretical property of BPSK modulated signals ... the carrier is absent. This gives BPSK a high efficiency, power is not wasted in a transmitted carrier. (The notch does not go to zero on the spectrum display because of limited resolution.) It is necessary to include at least the central "lobe", which is 4 MHZ wide here, and preferably the first two "side-lobes", which would require 8 MHZ, in the receiver bandpass order to preserve signal quality. Quality, expressed as signal to noise ratio (S/N), is precious in a SVAS system and it must be preserved at every possible point.

So we have a wide band signal at 1687.1 mhz ... how weak is it and what will be needed for a receiver? Well, we must consider the antenna and LNA before the receiver or any data processing. It will turn out that these components will make or break the whole system. We can do a few calculations, look at the requirements they produce and decide to go on or quit right there. The major problems in duplicating a SVAS system are likely to occur here.

Now it is necessary to get technical. The following equations provide the tools to determine whether the space and resources you have will allow SVAS reception. The signal to noise ratio (S/N) at the receiver input is expressed by equation 1.

$$S/N = (EIRP)*G / (K*T*B*L) \qquad 1)$$

Where: S = unmodulated signal power
$EIRP$ = effective isotropic radiated power from GOES
G = receive antenna gain
L = path loss at channel frequency
K = Boltzman's constant
B = channel bandwidth
T = equivalent receiver input noise temperature

S/N can also be expressed as the the ratio of energy per data bit to noise density by equation 2:

$$S/N = R*Eb/B*No \qquad 2)$$

Where: R = bit rate
Eb = energy per bit
B = channel bandwidth
No = noise density

We can find published curves for a perfect demodulator which relate Eb/No to the bit error rate. The bit error rate is a better quantity than Eb/No to specify because it describes what we really care about ... data errors. So we will use these curves to get Eb/No for equation 2.

Now set equations 1 and 2 equal, eliminating S/N, to obtain G/T as equation 3. G/T describes the performance required of the system "front end" under a given set of channel and transmitter parameters for the desired bit error rate. Equation 4 converts this to decibel form. An additional term M has been added to equation 4 to account for miscelaneous losses such as feedline, polarization loss, etc.

$$G/T = (Eb*R*K*L) / (No*EIRP) \qquad 3)$$

$$G/T = E_b/N_o \text{ db} - \text{EIRP dbm} - K \text{ dbm} + L \text{ db} + 10 \log R + M \text{ db} \qquad 4)$$

Typical values of these parameters for GOES VAS are:

EIRP = 55 dbm
L = 189.3 db at 1687 Mhz
K = 198.6 dbm
Eb/No = 10.6 db for Pe = 10E-6
R = 2,110,360 bits/sec --> 63.25 db
M = 3 db

We plug these numbers into equation 4, and obtain 12.5 db as the required G/T. This may be related to antenna size and LNA performance by making a few realistic assumptions:

a) Antenna noise temperature = 70 K
b) LNA gain and receiver noise temperature are adaquate for the LNA to control overall noise temperature.
c) Antenna feed efficiency = .55

Now we tabulate the results for some common antenna sizes. The "maximum" figures are the largest these quantities can be and still maintain a 10E-6 bit error rate:

Antenna Dia.	Antenna Gain	Maximum System Noise T	Maximum LNA Noise Temp.	Maximum LNA Noise Fig.
24 ft.	40 db	562 K	492 K	4.3 db
18	37	282	212	2.4
16	36	224	154	1.8
12	34	141	71	.95
10	32	89	19	.28

The "bottom line" of this table is how good the LNA must be for each antenna size. We can pick the antenna likely to get past our budget, wife, zoning board etc. and then see what is required for an LNA. There is a little, ... very little, padding in the assumptions from the M (miscellaneous) factor but this will disappear fast in connectors, cables, pointing error etc. etc. I can assure you from experience that the table is not just fancy theory. It means what it says, there will be no pictures, or very poor pictures, with a 12 foot antenna if the LNA noise figure is much worse than 1 db !

Fortunately, the television satellite receive only (TVRO) industry, although not as healthy today as it was two years ago, has provided us with a good source of antennas. It is relatively easy to obtain TVRO antennas at modest cost up to 16 feet in diameter. The LNA required for a 10 foot diameter is clearly impractical but 71 degrees, as required for a 12 foot antenna, is within reach of modest cost commercial LNAs. Practical amateur LNA designs would probably fall in the area of

154 degrees and require a 16 foot diameter. Therefore we can conclude that the necessary GOES SVAS antenna size is in the range from 12 to 16 feet diameter. We must watch out for a sneaky assumption in the table, however: the LNA gain must be high enough to control system noise figure. This means that single stage (typically 14 db gain) designs will normally not be adaquate. For example, if the LNA has a noise figure of 1 db (75 deg. K) and a gain of 14 db then when used with a downconverter which alone has a noise figure of 6 db (864 deg. K) the overall noise figure will be 1.4 db (109 deg. K). This is a degradation of 34 degrees K in noise temperature which could make the differnce between good and poor pictures with a 12 foot antenna. A minimum of two stages with about 30 db gain is required for the LNA to control the overall noise figure with most downconverters.

To summarize, you will need a 12 foot diameter dish antenna with a very good LNA (probably not home built) or a 16 foot diameter dish with an LNA which could possibly be home made. Since GOES is a geostationary satellite, any of the commercial mounts made for TVRO satellites will be quite suitable. The feed horn cannot, of course, be the same as for TVRO but that is no problem. The very same feedhorn designs we have been using for years on WEFAX are inherently wideband designs. They will work as well for for the SVAS signal at 1687 MHZ as for WEFAX at 1691 MHZ. I will give a design in the next article for such a feed horn but these designs have been published many times in the WEFAX literature. Figures 2 and 3 show my antenna system. It is a 13 foot diameter dish made by Hero Corporation in Hileah Florida. The aluminum feed horn is the design I will be presenting next time. The mount is an old azimuth-elevation type made by KLM Corporation for TVRO. It is no longer in production, but az-el is really not necessary, I simply had it on hand.

I will not be giving circuit or construction details for the LNA. It is a difficult, tricky, matter to build a LNA with a true noise figure less than 1 db at 1687 Mhz, even for professionals. It was almost impossible ten years ago, and just hard now. (This fact, by the way, is the reason most literature assumes amateurs will not be building VISSR or VAS receiving systems. Fifteen to twenty years ago when the GOES system was designed, LNAs of the quality possible now did not exist and it was absolutely necessary to use an antenna of 24 feet diameter or larger. It seemed inconceivable that amateurs would build these. Of course there is ham "EME", but that is another story.) Consequently, I would suggest that the best approach is to purchase a suitable LNA. One company, Wilmanco, (19529 Business Center Drive, Northridge California 91324) has available a model 1687LNA for about $700.00. An example of an LNA design which could be home built appears in QST, August 1984, page 65. Another example appears in VHF Communications, Volume 3-1984, pages 130-136. The latter article presents a single stage low noise LNA as well as a two stage design with higher noise. For these designs to be effective, the two separate LNA's should be cascaded ... an approach which could also be used with commercial single stage LNA's such as the Microwave Modules MMG1691. Again, however, building and sucessfuly adjusting a two stage LNA is not recommended unless you have specific experience in this area. The LNA in my system is the Wilmanco and it is mounted in a housing at the rear of the horn feed. The LNA must be mounted here. If you put more than 1 foot of coaxial cable between the antenna feed and the LNA, you will seriously degrade system noise performance and waste money spent for both the antenna and LNA.

Note Added 1 March 1989:

Since these articles were first written, the situation regarding an adaquate home built LNA has changed substantially. A very satisfactory design which can be home made without elaborate test equipment or great skill appears in the Spring 1989 volume of the JESAUG (Journal of the Environmental Satellite Amateur Users Group). This design is capable of about .6 db noise figure and simultaneous 36 db gain.

Almost any previously published design for a WEFAX feedhorn for 1691 MHZ, such as the one found in Ralph Taggarts' "Weather Satellite Handbook" can be used for VISSR since the bandwidth of these designs is at least 100 MHZ. The reason that I present another design has to do with the horn material. Previous designs, such as Taggarts', suggest using a 1 pound coffee can for the cylinder. While the dimensions of a standard coffee can are fortuitously good, the plated steel material is not unless it is carefully painted to prevent rust. If you do not repaint or if you casually add just a little, I have found them to rust badly in one to three New England winters. A warmer, more arrid, climate will allow much longer service but in case you don't live in such a locale, the aluminum design sidesteps the rust problem and helps preserve precious S/N ratio. The aluminum can needed for this design is a Zero Corporation #ZTR-81B and semi-difficult to obtain in small quantities. Anyone wishing to build this design should contact the author regarding availability of the can.

The LNA should be mounted as close as possible to the probe in the dish feed horn. This means building a weather resistant housing on the back or side of the feed horn to enclose the LNA and running no more than a foot of 50 ohm coax to the probe. A little cable here, with a few tenths of a db loss, may help the stability of a marginal LNA but any more than about half a db will be sorely missed from system S/N ratio. The LNA output, if it is a two stage design with over 25 db of gain, will be able to drive up to about 100 ft. of 50 ohm coax.

The next link in the system is the downconverter. There are a number of options here, both commercial and homebuilt. Noise figure and gain of the downconverter, while less important than those of the LNA, cannot be neglected altogather for VISSR use. The VISSR signal is centered on 1687.1 MHZ and occupies about 6 MHZ of bandwidth. Fortunately most WEFAX downconverters are sufficiently broadband that there is no practical difference in input tuning for the VISSR signal as compared to WEFAX. A typical input bandwidth is at least 50 MHZ and this will cover both signals easily. The output frequency, however, will not be the typical 137.5 MHZ. There is no receiver in the usual sense in a VISSR system. The output of the downconverter is amplified, filtered to limit the noise bandwidth and fed to a phase detector where the data is demodulated. Therefore the choice of output frequency for the downconverter must be suitable for easy amplification, filtering and phase demodulation. There is considerable lattitude in choosing this frequency, it can range from about 10 MHZ to 100 MHZ, but a very convenient choice is 70 MHZ. This is convenient because it is used by many radar, television and digital data systems. Parts such as filters, ampilfiers and phase demodulator components are more easily obtained for 70 MHZ than for other possible choices. The downconverter must therefore produce a 70 MHZ output for 1687.1 MHZ input. For homebuilt circuits this is not a difficult design change, simply recalculating the crystal and revising the output amplifier coil or transformer to resonate at 70 MHZ, keeping in mind that the Q should be low enough to allow at least a 6 to 8 MHZ bandwidth. One caution should be noted regarding the choice of 70 MHZ, however. Television broadcast channel 4 occupies the slot between 66 MHZ and 72 MHZ with the picture carrier at 68.25 MHZ. To avoid interference from a strong channel 4, all of the wiring and chassis from the downconverter through the IF amplifier and phase demodulator should be well shielded.

Among commercial downconverters, the Microwave Modules MMK1691/xxxx is a suitable choice in the $275 price class (as of 1987). The xxxx in the model number refers to the IF output frequency. It is usually sold as MMK1691/137.5 with a 137.5 MHZ IF. One of these can be readily modified for 70 MHZ output by changing the oscillator crystal to 89.8333 MHZ, rewinding the two IF output stage coils, and retuning. It can also be ordered, at slightly higher cost, as MMK1691/70 with the modifications already made. Either way the resulting downconverter will have a conversion gain of 25 to 30 db and a noise figure of about 3 db which is fine for VISSR use.

Looking again at signal levels, with a 13 foot antenna, a feed horn similar to that described, "dead on" pointing of the antenna and polarization of the feed horn, you can expect a signal at the input to the LNA between -105 dbm and -112 dbm. The uncertainty comes from possible differences in antenna and feed efficiency, and other miscellaneous losses. With a 25 db or more gain LNA such as the Wilmanco, and 50 feet or less of good coaxial cable such as RG213, the input to the downconverter will be about -85 dbm. With a 27 db conversion gain, typical of the MMK1691/70, the signal out will be about -58 dbm, centered on 70 MHZ.

The next block of the system will be a 70 MHZ IF amplifier to filter and bring this level from -58 dbm up to -10 dbm. There must be reserve for level adjustment so the total gain required is about 60 db. The minimum bandwidth of this amplifier is 4 MHZ at +/- 3 db. The maximum bandwidth is not critical but should be less than 10 MHZ since excess bandwidth here will degrade the system S/N ratio which we are trying to preserve or enhance in every cost effective way that we can. There are a number of ways to obtain the IF amplifier. Surplus equipment available at flea markets will include radar, television distribution, digital radio or TVRO IF strips which can be used with little or no modification. Commercial amplifiers are of course available with appropriate specifications but these can be very expensive. A third way to go is to build the amplifier yourself. At 70 MHZ, parts layout is not exceptionaly sensitive and if you have had a little experience with RF circuits then this approach is practical. Figure 5 gives a suitable design.

This is a high gain RF circuit and must be built with good RF construction practice. This means short leads, a ground plane under the parts, and good decoupling on the 12 volt power supply distribution. The AGC control will be adjusted to provide about -15 dbm output at 70 MHZ to the demodulator. The maximum gain available is about 65 db which should be sufficient for even a low gain downconverter. The bandwidth is about 12 MHZ, which is larger than necessary but the single tuned response produces a smooth low distortion phase slope at the edges.

Assuming that we now have the 70 MHZ signal at about -10 dbm, the next step is a phase demodulator. This circuit is a little tricky. The binary data has been modulated onto the carrier as BPSK, zeros are sent with the carrier phase unchanged while ones are sent with the carrier phase shifted 180 degrees or inverted. In order to build a practical phase detector it is necessary to have a replica of the exact carrier frequency, however the spectrum of the received BPSK signal has no component at the center to define this carrier frequency. An ordinary phase locked loop, for example, cannot be used since there is no carrier for it to lock onto. There are a number of circuits in the literature which have been devised to deal with this problem and all depend on some kind of nonlinear operation on the signal to recover the carrier. For example, squaring will produce a component at twice the carrier frequency which can be divided by two to yield the desired signal. For VISSR use, a good circuit choice is the Costas Loop.

The Costas Loop is a variation on a phase locked loop which compensates for the lack of carrier, or expressed in another way, it compensates for the phase reversals of the carrier. Figure 6 is a block diagram of the Costas Loop. The input signal is split into two channels and mixed (multiplied) by the local voltage controlled oscillator at zero and ninety degrees phase shift. The baseband output of the mixers is filtered by lowpass filters with a cutoff just above the data rate. These filters are the final determination of overall noise bandwidth. The two channels are then multiplied togather and the output fed as correction to the VCO. Demodulated data appears at one of the lowpass filter outputs and frequency error appears at the other. In a crude way the loop operation can be understood by thinking of the data input to the VCO multiplier as reversing the correction phase at the proper times to be in step with the carrier phase reversals and therefore fooling the VCO into behaving as in an ordinary phase locked loop. At any rate, it does work and the output from this circuit is the VISSR data stream we want, at 2.11 MBPS. Trying to examine this data stream on a scope, by the way, is an exercise in futility unless it is a storage scope. If you trigger on the transitions with a non-storage scope, sucessive lines will overlay and you will not see individual ones and zeros, just their superposition. This is commonly called an "eye" pattern and is very useful anyway in diagnosing signal quality. The degree to which the center part of the eye is clean and free of any out-of-place transitions is a measure of S/N. For sucessful VISSR pictures, the eye must be at least 80% open, hopefully more.

A detailed schematic of the Costas Loop demodulator appears in figures 7A & 7B. The only part of the circuit which requires care in layout and construction is the 70 MHZ voltage controled oscillator and amplifiers. This section should be built above a ground plane with short leads and good power supply decoupling to prevent any parasitic oscillation. The remainder of the circuit is not critical as long as reasonable rf construction practice is followed.

The lock bandwidth of the loop will depend on 70 MHZ input level and should be adjusted to about -15 dbm. The loop is tuned by observing the output on an oscilloscope while adjusting the VCO with the 10K tuning potentiometer. The loop time constant is about 1 second, so the adjustment should be made slowly. As the VCO approaches 70 MHZ, the output will show a beat frequency which will clearly lock at 2.11 MHZ. It may be necessary to tune to the other side of lock and back up as the lock character is not symmetrical around the lock point.

The raw data stream out of the demodulator contains the combined VAS data and clock which have been exclusive or multiplied togather. The quality of the signal can be judged as described above by triggering an oscilloscope on the signal transitions and adjusting sweep speed for about 2 bit times across the screen. It will be normal to see lots of jitter on the edges but the pattern should be free of noise and stray transitions in at least 80% of the middle of each eye.

The next block of the system is the bit synchronizer to separate the clock and data which have been combined into this bit stream. At this point we are recovering a bit stream in which the data and clock have been multiplied togather. This is a very simple, binary, operation done by an exclusive OR cicuit where the data is one input and the clock is the other. It is done to increase the transmission efficiency. Sending the clock on a separate channel would be wasteful since it carries very little information, only its phase and frequency. Reversing the process to separate data and clock again, however, is not so simple. The problem is that after the multiplication we don't know readily whether a particular transition belongs to the clock or the data. It is only in the longer term (many bit times) that we can be sure that there have been on average, R, clock transitions where R is the clock rate.

This fact, that on average the bit stream carries a constant clock rate, is the clue to clock recovery. In the frequency domain, if we look at the bit stream on a spectrum analyizer, there will be multiple peaks spaced at the clock rate. A straightforward idea for recovery is to feed the bit stream to a phase lock loop and see if it will synchronize to the "hidden" clock. This almost works. The problem is that except for special cases, even though the spectrum peaks are spaced at the clock rate, there are nulls at the actual clock frequency and its multiples. There are a multitude of spectrum lines for the PLL to lock on, but none at exactly the right frequency ! Fortunately the solution is easy for moderate to high signal to noise ratios. If we feed this bit stream to a nonlinear circuit of some kind (almost any kind) we will regenerate spectrum lines at the clock rate and its multiples. By filtering out the fundamental and feeding this to the PLL, we will have recovered the pure clock. The bandwidth of the PLL must be set low enough to suppress phase jitter from the "random" data transitions but this is not a critical parameter.

A suitable circuit for clock recovery appears in figure 1. The first section of this circuit is simply a filter matched closely to the spectrum of the data bit stream in order to remove noise as far as possible without cutting into the information itself. Following this is an edge detector or differentiator which forms short pulses on the edges of the filtered waveform. For a noise free signal this would produce a "spike" at each edge of bit stream. This is the nonlinear operation which regenerates the clock lines in the spectrum. The pulses are then used to synchronize a PLL running at twice the clock rate. The 2 x clock line is strongest in the regenerated spectrum and most reliable for PLL lock. The PLL frequency divided by 2 then yields the 2.11 MHZ clock we need to synchronize further operations.

In order to complete the process of deriving a separate clock and data stream we must account for the NRZ-S coding of data prior to combination with the clock. NRZ-S coding replaces the original data with a transition, either 1 to 0 or 0 to 1 depending on the original state, when the source data is a zero. If the source data is a 1 then the output stays in its original state. For example a continuous data 1 would produce no output transitions while a continuous data 0 would produce a square wave output at the bit rate. In the VAS case it is this NRZ-S coded data which has been multiplied by the clock. The HC175 and exclusive-OR gate in the circuit of figure 1 strip off this encoding and produce a clean, separated data output. Additional circuitry in figure 1 examines the data stream for coherence between the clock and provides a signal to indicate whether or not there is valid data coming out. If there is, the "BIT SYNC" light comes on. During normal operation this light will blink out during the 50 millisecond period every spin (600 milliseconds) when the VAS transmitter is turned off.

FRAME SYNCHRONIZER

Now we arrive at something of a problem in planning. The current format of VAS data is organized according to a scheme called "Mode AAA". This specifies the exact placement of telemetry data, image data, and synchronizing bits within the overall flow of data and must be used to comb out the images we want. The frame synchronizer is a very specific, dedicated design which uses the format description to arrive, finally, at individual image bytes which can be placed in an image frame buffer to display the pictures. Unfortunately, NOAA is currently in the process of revising this formatting scheme to another version called "GVAR" to be effective with the launch of the next GOES satellite sometime in late 1989 or 1990. As a result my design for the frame synchronizer, while it works fine today and can be duplicated, will only be valid until the next GOES launch. I will be revising the frame synchronizer design to work with GVAR but this won't be completed until late this year or early 1989. Consequently the remainder of this article will be more of an overview of the circuits and process than in previous sections. If any readers do want to duplicate the mode AAA circuitry I will be happy to provide the circuits and more detailed information.

Once the separated clock and data are obtained at the output of the bit synchronizer, the processing becomes entirely digital. However, the high bit rate, 2.11 MBPS, and the requirement to locate specific patterns in the data stream to identify image boundarys precludes feeding the data directly into a personal computer serial data port. Even "turbo" speed PC's would not be able to ingest this data and separate telemetry from image bytes at the required rate. Fortunately the task can be done simply in dedicated hardware and provide organized image data to the PC from memory mapped onto its own data bus.

The basic frame of stretched VAS data is organized as 12 blocks, each lasting 50 milliseconds. This entire frame, which takes 600 milliseconds, is transmitted during one revolution of the satellite spinning at 100 rpm. The beginning of each block is identified by a unique 10,032 bit pattern in the data. The frame synchronizer must identify a fragment (or all) of this pattern precisely and then use the identification time as a reference point from which to count out bits and words representing the desired images. Several methods exist for identifying this initial block synchronization word. Digital correlation by integrated circuits such as the TRW 1023 is straightforward but expensive. The method used in the present circuit designs compare the ongoing data bit stream with the output of a PN sequence generator which itself produces the synchronizing pattern. If there is a mismatch, the local generator is restarted. Eventually there will be coincidence between the two patterns and when they have run togather to the end of the sequence, a flag is set for other circuits to begin operating. The local generator is allowed to continue running because the data must be multiplied by this sequence to remove a randomizing function imposed at the transmitter.

The organization of data in the 12 blocks of each line is described in the NOAA/NESDIS publication "Operational VAS Mode AAA Format, Specification SFP 002 - Version 2.2". Each block consists of a general information header giving the block number and other details, and an information field containing image documentation and the image data itself. The frame of 12 blocks contains data for 1 line of infrared image in two different spectral bands and data for 8 consecutive lines of visible spectrum image. There are 3822 ten bit image words in the infrared blocks and 15,802 six bit image words in the visible spectrum blocks. The documentation fields of these blocks contain a wealth of information for calibration, gridding, location of the field of view, orbit parameters, and so forth. There is so much information, not to mention so many image words, that the primary design task for a low cost system is deciding what to eliminate. The principle technique for simplifying the reception hardware and lowering its cost is to select a small portion (512 bytes) of the incoming data which is adaquate for the users purposes and saving only that portion in a cache RAM. At the end of the block there is adaquate time to transfer this cache into the associated personal computer. The cache interface hardware is configurable for selection parameters, mainly the number of consequtive image words to skip, so that different geographic coverages can be achieved. By saving only every 30th image word for example, the entire width of the full globe can be displayed in a 512 byte image line. The actual resolution in this image would be quite low, of course, but when smaller geographic areas are desired, fewer image words are omitted and the resolution is approximately matched to the field of view.

The design of the cache RAM and associated timing hardware will be highly specific to the personal computer selected for data handling and display. The present frame synchronizer circuits are intended to work with the common XT class computer. This interface maps the temporary cache storage into the XT memory space and issues interrupts at the beginning and end of each data block. The beginning interrupt allows identification of the block and a decision on keeping or skipping that block. If it is to be kept, the data is transfered out of the local memory following the subsequent interrupt and directly into the image frame buffer memory for immediate display of the line. This technique avoids any requirement for extended memory on the main computer bus. Timing parameters are set up through several I/O ports on the interface. In addition to image data, the general information telemetry available in the IR blocks 1 and 2 is extracted, displayed and updated on the XT computer screen once per line.

High speed operation of the computer is not a prerequisite, my system operates at the lowest common clock speed, 4.7 MHZ, and adaquate time is available for collecting 512 data bytes per image line and transfering them to the display memory.

FRAME BUFFER

As in the choice of computer, the choice of a frame buffer for video image display is wide. The conventional CGA and EGA display cards are not suitable for the purpose because their resolution and grey scale are too restricted for satisfactory VAS images. Some of the recent VGA displays will provide 640 pixels x 480 lines at 256 colors/grey shades which is adaquate for some uses. A more satisfactory solution, still at moderate cost, is to use an "image processing" type frame buffer card available from several manufacturers for both XT and AT class computers.
The minimum configuration of these buffers is 512 pixels x 512 lines at 256 colors/grey shades and a typical example is the AT&T TARGA model M8 in the $2000 price class. This is entirely satisfactory for monochrome VAS image display and allows experimentation with color representation of albedo.

The final consideration in the low cost system assembled around the XT or similar personal computer is longer term storage of the images. The technique described stores the image in the local memory of the frame buffer while it is viewed. If it is to be saved it can be transfered out of the frame buffer onto fixed disk or floppy disk. One 512 x 512 image will require 225K of storage space but this can be reduced by any of the popular "archive" data compression programs to about 150K.

-=-

Ive just bought a used MFJ-1278 to use at my monitor station and need a bit of help with it. It came with version 0 of the manual (a yellow color). This manual is the worst ive ever seen, it does not list half of the commands available and it has only details on packet. No mention of RTTY, CW, AMTOR, FAX, or SSTV. So if anyone has a list of the commands with options, or can supply info on how to use the amtor, fax, or sstv modes - please share them with me. Ive gotten it to work with RTTY and CW (though CW seems to be a bit flakey) but ill also accept any help with these modes. Packet, well ive done some monitoring but the manual covers al I need to know.

Send all replies via e-mail and ill post a summary if the net wants.

>The answer to that question today is a strong "no": today's DSPs
>typically require programming in rather esoteric assembly languages,
>and require the programmer to have a good theoretical knowledge of
>signal processing.

For dedicated DSP applications this is definately true, since the data rate is so high that only fast hardware will do the job. You would be amazed at what can be done on a 68000 these days, though. A bit of creativity and some theory can yield filters, FM demodulators, peak detectors, and other things. You still have to be able to write code that uses tricks and runs fast, though. The theoretical knowledge is also required so you can know the limits of what you want to do. To me, DSP isn't a synonym for "doing lots of math real fast". It means being able to use a CPU to process a continuous stream of numbers to yield a desired result. Of course, being able to bang bits at lightspeed is usually required for all the fun stuff, though.

>Unfortunately, Gabriel is written in Lisp, and requires something like
>a Sparc-1 with 16 MB of memory to use. But as hardware prices fall and
>performance increases, it may not be that long before homebrewers are
>able to afford that sort of setup.

Personally, I like to use MatLab for DSP simulations. It runs on a PC clone (but requires a math co-processor) and contains built in functions to do things like FFT's, digital filtering, etc. You can also write your own functions. Note that this is just a proving ground for your ideas, though. MatLab isn't designed to do things in real time. It's just an easy platform to program up an idea and check out the validity. You will still have to have a good CPU and compiler to implement the concept and handle signals that are live.

WANTED   WANTED   WANTED

I'm looking for a 24 VDC power supply with about 7 to 10 amps.
This will be used by the students at Newberg High School for the
study of motors and robotics. Regulation is not critical.

If you have access to something like this, a donation or loan
would be appreciated.   The school has no money for the purchase
of a supply.   If you can help, it will make you feel real good
that you're helping these young people learn about science.

That wasn't the intended thrust of my question. I intended to convey this:
"How do people get their licenses without learning enough to answer at least
some of their own questions?"

My own perception is that, for example, anyone with an Extra Class license
really ought to be able to read a circuit diagram well enough to tell which
pin goes where on a mike jack and similarly elementary questions. A Novice?
Maybe not. An Extra? Certainly!

Probably just what it sounds like. Transmit the picture created by a camera pointing at a radar PPI scope. We did it around here years ago.

Most phone DXing and contesting is conducted in English (well, most is in Amurrican but we'll overlook that). Suppose you were Japanese, didn't speak English, but got interested in amateur radio and DXing. Do you really think that learning cw in order to do cw DXing would be such a terrible thing when compared with having to learn English in order to do phone DXing?

How many of the licensed Russians (for example) know English well enough to converse over the air, pick out weak calls with non-standard phonetics etc? If you want to work lots of Russians from here, it's a good idea to be able to use cw. Sure, you can work all the oblasts on phone, but the last time I heard of someone doing that it was reported as a "gee whiz" achievement in a DX mag, while nobody ever gets a mention for working them all on cw.

What's my point?   Just that the dislike of cw among some of the people on this net is probably conditioned by the fact that speaking English is not a problem for them. If international communications were all either in CW or in Japanese, you would be facing the same sort of choice that many Japanese face in getting on the air.   It also means that if you want to work lots of JAs and UAs it is a good idea to stay fluent in cw.

I don't see a lot of difference between the attitudes "they should all learn my language" and "I shouldn't have to learn cw", or, for that matter, "why can't you get a decent hamburger and fries in Burkina Faso?" (sadly, you probably can).

I understand that this is not addressing the current requirement to learn cw in order to make "I'm on my way home, honey" calls on 2 meters, but the no-code thing goes further than that, I think. Most anti-code people would like to see the cw requirement dropped for HF operation, and the next logical step would be opening the cw bands for phone operation. Meanwhile, a good fraction of all the "foreign" stations will still be using cw because it is easier than learning English for many of them.

I also realize that I am equating "HF operation" with "DXing" but I think of them as the same thing. I don't go on 20m in order to talk with people in the same country, although some people obviously do - they need professional help :-)

We are repeating ourselves on the code wars again. We are also totally off on the "Code ain't hard, Father, it's my bother!" tangent, which is totally irrelevant.

I earnestly hope Paul Flaherty will rescue us by re-serializing his brilliant "History" piece.

How about identifying "Mr HIGH UP"? These are serious allegations. If such a plot exists, it could be short-circuited by a little "premature" public and media awareness of government shenanigans. If it cannot be proven, these scare rumors are not welcome. They do more harm to the hobby than good.

I just picked up an interesting little device at a close-out store in NY. It's called SOUND SENDER, and it's one of those devices designed to interface an outboard tape player or CD player to your car's FM radio. Here's the twist: it does not connect to the car radio - it transmits to it.

Opening up the device (which looks like an oversized cigarette lighter plug with a fine tuning knob, and audio cable coming out) I find a single PC board containing some passive parts, a tuneable coil, and a large "antenna" in the foil pattern. It seems to transmit the audio input (in mono) via brute force.

At home it could easily transmit to a stereo receiver across the room. There is no FCC information on the package or device, and no statement of the output power. Is this legal? Or is that why it's being closed out :-)

RADIO-M1/RUDAK-2

The joint work of AMSAT-U and AMSAT-DL for creating the set of equipment for the satellite RADIO-M1/RUDAK-2 is completed.

The idea of the cooperation between two groops in the USSR and Germany appeared in the spring 1989. The discussion about what and how it is necessary to do lasted till the meeting of the representatives of two groops in Surrey in July 1989 when the mutual preliminary agreement about the cooperation was signed.

The final version of the agreement about the cooperation was signed in the autumn 1989, when the work over the project was being done.
According to the mutual agreement the group ORBITA AMSAT-U develops and makes the linear transponder, command radio link, telemetry system, power supply system and decides all the questions with the official organisations about the placing of the equipment and launching.
The RUDAK group of AMSAT-DL developes and makes the digital part so called RUDAK-2. This part includes a digipeater and a mailbox (protocol AX-25).It also provides other possibilitys for the experiments on the transmitting of the information using modern digital methods. It also contains input and output RF circuits.
The complete set for ground command station is developed by Amsat-U-Orbita and Amsat-U-Sputnik groups.Rudak group brings special digital part for it.
During the launch and orbital test period ground command station will be situated in Molodechno at UC1CWA and in Moscow at RK3KP. The ground command station for Rudak-2 only will be situated near Munchen-DK1YQ and near Hannover-DB2OS.

The final agreement was signed:
from the side of AMSAT-U-ORBITA the technical director of the project "RADIO-M1" - V.Chepyzhenko - RC2CA;
from the side of AMSAT-DL - the president of it K.Meinzer - DJ4ZC.
The coordinators of the project are P.Guelzow - DB2OS and L.Labutin - UA3CR

SPECIFICATIONS OF THE RADIO-M1/RUDAK-2

Mission

Piggy-back onboard the USSR geological research satellite.

Launch and Orbit

1. Launch (scheduled)
   Time: Late of 1990, day is not fixed.
   Launch site: North Cosmodrom Plesetsk

2. Orbit (planned)
   slightly elliptical polar orbit
   appogee: 1000 km
   Inclination: 83 degrees
   Period: 105 minutes

Satellite specifications

1. Dimension and shape
   Cylinder of hight about 4 meters
   diameter 1.8 meters

2. System configuration
   Professional geological research equipment, telemetry system, command link equipment, transponders and power supply, thermal control.
   Amateur linear and digital transponders, telemetry system, command link equipment, power supply.

3. Attitude control
   Satellite attitude will be maintained by the earth's gravity field by a rod 9 meters length pointing away from the earth.

4. Planned service life: 3 years

Radio-M1/Rudak-2 System specifications

1. System configuration
   Two sets of the equipment will be installed aboard the satellite:
   Linear transponder #1 mode B and RUDAK-2 with subsystems
   Linear transponder #2 mode B with subsystems
   The first set is concidered to be the main. The second one is reserve. It can be taken into operation in the case of failure of the first one.

2. Commands

   Equiped with real-time program command function

3. Beacons and telemetry #1 set

CW telemetry 8 channels	145.822 MHz	0.2 Watts
Digital telemetry 30 channels	145.952 MHz	0.4 Watts
	1100 bps,BPSK/FM, deviation 2kHz	
Digital telemetry Rudak-2	145.983 MHz	3.0 Watts

BPSK 1200 bps AX.25 (like FO-20)

4. Beacons and telemetry #2 set

CW telemetry 8 channels	145.948 MHz	0.2 Watts
Digital telemetry 30 channels	145.838 MHz	0.4 Watts
	1100 bps,BPSK/FM, deviation 2kHz	
Digital telemetry 30 channels	145.800 MHz	2.0 Watts
	1100 bps BPSK/FM, deviation 2kHz	

5. Transponders #1 set

(1) Linear transponder: inversely heterodined translator

Uplink passband	435.102 to 435.022 MHz
Downlink passband	145.852 to 145.932 MHz
Transmitter output max	10 Watts
Bandwith (3db)	80 kHz
Uplink EIRP required about	100 Watts

(2) Digital transponder Rudak-2: digipeater and store&forward packet communication (AX.25), telecommunications experiment with digital signal processing up to nearly 20 kHz, 1 MByte RAM disc, four separate uplink channels.

Uplink frequencies:	RX-1	435.016 MHz	1200bps,FSK,NRZIC/Biphase-M
	RX-2	435.155 MHz	(AFC) 2400 bps,BPSK, Biphase-S
	RX-3a	435.193 MHz	(AFC) 4800 bps,RSM
	RX-3b	435.193 MHz	(AFC) 9600 bps,RSM
	RX-4	435.041 MHz	(digital AFC) RX for RTX-DSP

Downlink frequency: 145.983 MHz 3 Watts

The downlink can be switched to the following operating modes:

Mode 1: 1200 bps, BPSK, NRZI,(NRZ-S) (like FO-20)
Mode 2: 400 bps, BPSK, Biphase-S (Oscar-13 beacon)
Mode 3: 2400 bps, BPSK, Biphase-S
Mode 4: 4800 bps, RSM, NRZIC (Biphase-M) (like 4800 bps uplink)
Mode 5: 9600 bps, RSM, NRZI (NRZ-S) +Scrambler (like 9600 bps uplink)
Mode 6: CW keying (only for special events)
Mode 7: FSK (F1 or F2B),e.g. RTTY, SSTV, FAX, etc.(for special events)
Mode 8: FM modulated by D/A signals from DSP-RISC processor (speech)

6. Transponder #2 set

Linear transponder: inversely geterodined translator

Uplink passband	435.123 to 435.043 MHz
Downlink frequencys	145.866 to 145.946 MHz
Transmitter output max	10 Watt max.
Bandwith (3db)	80 kHz
Uplink EIRP required about	100 Watts

7. Antennas

(1) 435 MHz receiving antenna (shared by analog and digital modes):
Helix +3 db max RHCP.

(2) 145 MHz transmitting antenna:
Half wave dipol

8. Power supply

From main power supply system up to 100 Watts
Set #1 consumption 47 Watts
Set #2 consumption 40 Watts

9. Weight

Set #1 approx. 28 kg
Set #2 approx. 22 kg

10. Size: 480x400x300 mm^3 each set.

SB ALL @ AMSAT $ANS-314.01
PACSAT BBS TESTING CONTINUES

HR AMSAT NEWS SERVICE BULLETIN 314.01 FROM AMSAT HQ
SILVER SPRING, MD NOVEMBER 10, 1990
TO ALL RADIO AMATEURS BT

PACSAT BBS S/W Beta Testing Continues; Expected User S/W Release Nov. 17, 1990

On Sunday evening, Nov. 4, 1990, NK6K commenced the Bulletin Board System (BBS) operations on AO-16. AO-16 now becomes the second satellite to be running G0/K8KA's spacecraft application software, along with UO-14. The first file uploaded to AO-16 was a file which acknowledged all the individuals who have contributed to the MICROSAT program. Next, it was only fitting that NK6K send a congratulatory message to his colleagues at the University of Surrey (UoSat) via AO-16. Later, the AMSAT News Service (ANS) bulletins and Keplerian elements were uploaded and were earmarked to be "broadcast" continuously from AO-16.

For the next few days, G0/K8KA, NK6K and a group of carefully selected "beta" testers will continue to send messages back-and-forth in an attempt to "wring-out" any last minute software bugs which might have been missed. If no major problems are encountered, G0/K8KA's groundstation software and documentation will be release on Nov. 17, 1990. It will be available for downloading from the AMSAT/DRIG BBS at (214) 394-7438 and CompuServe's HAMNET. This software will allow users to upload and download files and allow users to receive files are continuously broadcast, for example, ANS bulletins or Keplerian elements.

The DRIG BBS will have a brand new section in the FILES menu, called MICROSATS ..... Go into FILES section, enter P for Personal download, and download all of the MICROSAT telemetry programs from this special area. This is OPEN to ALL AMSAT members.... Please do a L;MICROSATS to get a listing of all of the programs available to you.**

Although this first version of the groundstation software is not the "all-singing-all-dancing" software that NK6K and G0/K8KA would like for it to be, it will be more than adequate to allow those with an IBM compatible computer to start utilizing the BBS on AO-16, UO-14, and LO-19 as quickly as possible. At a later time, versions for the MacIntosh computers and upgraded IBM PC versions will be available from the AMSAT Software exchange. Look for further announcements next week in the ANS bulletins about the release and availability of the PACSAT groundstation software.
/EX
SB ALL @ AMSAT $ANS-314.02
AO-16 HAS A NEW SOUND

HR AMSAT NEWS SERVICE BULLETIN 314.02 FROM AMSAT HQ
SILVER SPRING, MD NOVEMBER 10, 1990
TO ALL RADIO AMATEURS BT

New BBS Software Gives A New Sound To A Young OSCAR

Since the commencement of BBS operations on AO-16 this week, users will find AO-16 sounds quite different from what they remember from the previous weeks. The biggest change AO-16 users will notice is that the 70 cm downlink transmitter is now sending data continuously. But even without the groundstation software, which is planned for a Nov. 17, 1990 release, it is still possible for you to see what is being sent on the downlink. The first thing you need to do is turn TRACE ON on your TNC-2. After doing this you will get a "hex" dump of the raw data frames being received by your TNC-2. Although this technique for receiving packet frames from AO-16 is not the normal way to receive packets, it will allow you to get a peek a what files are being broadcast and other file activity. For those who still wish to digipeat or who want to examine the telemetry, the BBS software will not change these functions, however, telemetry will be sent every 30 seconds as compared to every 10 seconds and digipeating will take more time because of all the other data on the downlink.

The one thing that users who start using the groundstation software will immediately notice is that using AO-16's BBS will be quite different from FO-20's BBS. If you try to connect to AO-16 without the proper groundstation software, after awhile you will be logged off. But when the proper software is used, it will allow users to compose messages off line and upload them very efficiently. If you fail to get the entire message uploaded during a single pass, the ground station software will remember where you were and it is from that point you can continue to upload on the next pass. The same holds for downloading a file; if it doesn't get completely downloaded during a pass, the groundstation software will remember where you were and will pick the file at that particular point on the next pass. The software protocol to perform these very "smart" file transfer operations will greatly facilitate packet traffic handling. It is AMSAT's hope that the PACSATs, ie., AO-16, LO-19, UO-14, will provide another powerful means for communication between radio amateurs worldwide.

[If you have questions on the protocols, you may reach NK6K on CompuServe at 71635,1174 or at nk6k@tomcat.gsfc.nasa.gov. G0/K8KA can be reached at k8ka@tomcat.gsfc.nasa.gov.]

BALLOON LAUNCH ANNOUNCEMENTS

HR AMSAT NEWS SERVICE BULLETIN 314.03 FROM AMSAT HQ
SILVER SPRING, MD NOVEMBER 10, 1990
TO ALL RADIO AMATEURS BT

Denver ATV Balloon Launch on Nov. 18, 1990 & Illinois Launch Dec. 1, 1990

A local Denver, CO AMSAT group and ATV enthusiasts are busily preparing for their upcoming balloon launch. The launch will be on Sunday, November 18, 1990 at 9:30 A.M. MST with a weather hold backup day of December 2nd again at 9:30 A.M. MST. The balloon should reach an altitude of 100,000 feet and will carry a color ATV camera and transmitter, a 2 meter CW modulated FM beacon and a telemetry package. The telemetry package will encode barometric pressure and inside/outside temperatures on an AFSK signal modulating the TV sound sub-carrier. The ATV frequency will be 426.25 MHz and 2 meter beacon frequency will be 147.555 MHz. Forty meter and two meter nets will be conducted on 7.232 MHz and 146.34/.94 MHz, respectively. AMSAT member Jack Crabtree (AA0P) has put together the enthusiastic team of AMSAT members along with a Denver ATV group called Western Vision Network (WVN). The balloon will use the callsign of the Director of WVN, Tim Armagost (WB0TUB). All AMSAT members and radio amateurs within 500 miles of Denver, CO are encouraged to participate in this "edge of space" experiment.

On Dec. 1, 1990 at 9:30 A.M. CST (weather permitting) a helium balloon with a 1 watt 10 meter beacon transmitter named "Drifter-1" will be launched near Champaign, IL. The beacon, located on 28.866 MHz will be sending the following text at 20 WPM: "DE N9JL/B THIS IS DRIFTER-1, A 1 WATT BALLOON CARRIED BEACON. QSL VIA KA9WWA AR." The period of transmission will be determined by package temperature. A launch and tracking net will be held on 7155 KHz beginning at 8:30 A.M. CST with WE9E serving as NCS. This balloon has the potential to be heard direct up to 350 miles and throughout North America during a band opening. Send your QSL and a s.a.s.e. to receive a QSL for Drifter-1 to:

Drifter-1
c/o Jim Lutz (KA9WWA)
2032 Adams. St.
Rolling Meadows, IL 60008

Queries regarding Drifter-1 can be send to KA9SZX @ W9YH.IL.USA.NA. Listen for updates on the weekly 75 meter ATV net on 3871 KHz beginning at 8:00 P.M. EST on Tuesday evenings.

ZRO TEST SCHEDULE

HR AMSAT NEWS SERVICE BULLETIN 314.04 FROM AMSAT HQ
SILVER SPRING, MD NOVEMBER 10, 1990
TO ALL RADIO AMATEURS BT

Fall Edition of ZRO Test Announced

The ZRO Memorial Technical Achievement Award Program, or just "ZRO Test" has a new schedule through the end of 1990 via AMSAT-OSCAR-13. This activity is a test of operating skill and equipment performance tested by copying signals decreasing in strength in predefined steps. At the beginning of the run, uplink power from the control station is set to match the general beacon downlink strength. This is level "zero". The control operator will send and repeat a random five-digit number, then lower uplink power by 3 dB (half power) and repeat the procedure with a new random number. This will continue to a level 27 dB below the beacon (level "nine"). A participating listener monitors the downlink signals till they can no longer copy the numbers. Those who can hear the beacon will qualify for the basic award by copying the code group heard at level "zero". The challenge is to improve station performance to a point where the lower-level downlink signals can be copied (levels 6 through 9). This then results in the need for less uplink power for routine communications operation.

The following schedule of Mode "B" and "JL" ZRO tests were chosen for convenient operating times and favorable squint angles. The "B" tests can be heard on 145.840 MHz and the "JL" test on 435.945 MHz.:

Saturday November 24, 1990 at 1700 UTC "B"

Saturday December 1, 1990 at 2030 UTC "B"
Saturday December 15, 1990 at 1630 UTC "B"
Saturday December 22, 1990 at 0530 UTC "B"
Saturday December 22, 1990 at 0645 UTC "JL"

Note that the dates and times are noted in "UTC." The tests on December 22nd occur late Friday night for those in North America. Any changes will be announced as soon as possible via the AMSAT HF and AO-13 Operations Nets as well as ANS. Recently updated ZRO brochures are available from WA5ZIB, Andy MacAllister, AMSAT V.P. User Operations, 14714 Knightsway Drive, Houston, TX 77083 for an S.A.S.E. with two units of postage. The brochure describes test procedures and means for obtaining certificates and gives some historical background about the program.

All listener reports with date of test and numbers copied should be sent to WA5ZIB at the address above. A report will be returned verifying the level of accurate reception. Good luck!

DXCC ON OSCAR 0

HR AMSAT NEWS SERVICE BULLETIN 314.05 FROM AMSAT HQ
SILVER SPRING, MD NOVEMBER 10, 1990
TO ALL RADIO AMATEURS BT

First DXCC on the Earth's Original Satellite

On October 27, Dave Blaschke, W5UN, worked VS6BI to complete the world's first two-meter DXCC. Although his DXCC is not the first "Satellite" DXCC, what makes Dave's accomplishment so unique, is that each of his contacts on two-meters was done by bouncing his signal off the moon (a.k.a. OSCAR 0). An article describing Dave's station can be found in January 1989 QST (p. 15).

Dave's station (1.5KW TX power and 32.5 dBi antenna gain) was uniquely equipped to help AMSAT recover DO-17, which suffered from a receiver de-sensing problem last spring. AMSAT Congratulates Dave on this monumental accomplishment.

[ANS thanks Ray Soifer, W2RS, for the information for this bulletin.]

PORTABLE 9.6K PACKET STATION

HR AMSAT NEWS SERVICE BULLETIN 314.06 FROM AMSAT HQ
SILVER SPRING, MD NOVEMBER 10, 1990
TO ALL RADIO AMATEURS BT

Effective, Low-Cost, Portable Packet Satellite Station Operational

Researchers at the University of Surrey took their portable packet satellite station out into the field and put it on the air last week. UoSAT/Microsat Software Developer, Jeff Ward G0/K8KA, used the 9.6KB semi-automated packet station to operate UO-14 from his flat (apartment).

As Jeff describes it, other than the antennas, the station fits in a metal carrying case about the size of a small briefcase. The RF gear (built by G0/VE3LMX in the UoSAT Lab) uses single-channel FM receiver and transmitter strips from Wood & Douglas with minor modifications. The transmitter generates 10W output, and no Doppler compensation is used. The receiver has a daughter board with an automatic frequency control circuit. This AFC sweeps the entire Doppler band until it detects the satellite, allowing for unattended operation.

The transmit/receive equipment costs less than $200. The system also uses a TINY 9600 modem (from Pac Com) which is added to the TNC as a daughter board. The TNC and modem both fit into the standard small extruded TNC case.

The receive antenna used was a 1.5 turn helix sitting on the ground pointed more or less straight up, with a turnstile for the uplink. Jeff's initial attempts with a 1/4 wave groundplane on receive gave little success. So as not to alarm his landlords, he put the antennas very close to the house. They are completely blocked on the south and west, but look fairly clear to the north and west.

On the evening of November 3, during a 60 degree pass east of his location, he managed to a connect to the spacecraft FTL0 BBS server, obtained a directory, uploaded a message and download about 16 kbytes. He then switched to the broadcast protocol, requested and received an AMSAT Keplerian element file. The next morning he was able to download a reply to his message. Jeff feels that he should be able to receive one hundred Kbytes of data on any pass of 10 degrees maximum elevation or better.

This effort shows that, as many people have shown in the past, you don't need lots of money to get into this corner of the hobby.

R.I. DXPEDITION A SUCCESS

HR AMSAT NEWS SERVICE BULLETIN 314.07 FROM AMSAT HQ
SILVER SPRING, MD NOVEMBER 10, 1990
TO ALL RADIO AMATEURS BT

DXpedition Proves to be Interesting on Both Sides of the QSO

AMSAT Volunteer Frank MacKensie-Lamb, NG1I, had been planning a DXpedition to the state of Rhode Island, but was undecided as to where to set it up. The week prior to his planned operation, Frank was contacted by a Ham in Rhode Island who had been interested in seeing an operational satellite station. Rather than have this potential newcomer drive up to Frank's QTH in Massachusetts, Frank decided to take the station down to the interested ham's QTH.

On Saturday, Nov 3rd, Frank drove to Lincoln R.I. and from the side yard of his host's QTH, NG1I/1 operated Mode B on AO-13 for approximately 5 hours. Because of advanced advertisement of his DXpedition in ANS as well as on the bird itself, a number of stations had already made plans to look for Frank that day and a mini-pileup ensued. By the end of his operation, Frank had logged 62 QSOs in 11 countries on 4 continents.

The interested host was extremely impressed by how little it took to get on the air on AO-13. Frank at times had to increase his output power to about 70 watts, due to poor squint angles, but as squint angles improved, he was able to throttle back to 45 watts and still carry on armchair copy QSOs, again proving that you don't need much power to carry on QSOs.

For those stations who did manage to help Frank demo his satellite station, his custom made QSL cards (made special for this DXpedition) can be obtained by mailing your cards to:

NG1I/1 Frank MacKensie-Lamb
P.O. Box 2058
Natick, MA 01760

One European station mentioned to Frank that he needed Wyoming, and he wondered if next weekend NG1I could do a DXpedition out to "0-land" Although Frank had to decline that particular request, it seems that the portable operation bug has bitten Frank, and so you may find additional satellite DXpeditions bearing the call NG1I (most likely they will be in the New England area).

SB ALL @ AMSAT $ANS-314.08
OPERATIONS NET SCHEDULE

HR AMSAT NEWS SERVICE BULLETIN 314.08 FROM AMSAT HQ
SILVER SPRING, MD NOVEMBER 10, 1990
TO ALL RADIO AMATEURS BT

AMSAT-NA Operations Net Schedule Announced

AMSAT Operations Nets are planned for the following times.
Mode B nets are conducted on an AO-13 downlink frequency of 145.950.
Mode J/L nets are conducted on an AO-13 downlink frequency of 435.970.

Date	Phs	mode	UTC	NCS	Alt.	U.S. day
17 Nov 90	145	B	1300	KA5SMA	WB9ANQ	Saturday
24 Nov 90	97	J/L	1430	WD0E	N5BF	Saturday
02 Dec 90	63	B	1530	WB6LLO	WA5ZIB	Sunday
08 Dec 90	156	B	1300	WB9ANQ	KA5SMA	Saturday
15 Dec 90	97	J/L	1400	N5BF	WD0E	Saturday

STS-37 astronaut Jay Apt (N5QWL) will be the featured guest on the 24 November 90 net. Jay will be discussing late plans for his own flight, which is to be flown next spring, and STS-35, which is scheduled for early December. This roundtable/interview session with N5QWL promises to be very interesting.

Nets are scheduled for North American geographic coverage and time zones although other parts of the world are often within the footprint and check-ins from everywhere are welcome. Those who don't have adequate and convenient coverage from this net are encouraged to schedule their own nets via AO-13. Write to AMSAT Headquarters or send a note to N5BF @ WB6YMH with your schedule to have it included in ANS.

For information on the amateur satellite program and how you can participate, contact AMSAT-NA Headquarters at P.O. Box 27, Washington, DC 20044, phone (301) 589-6062, or contact your local AMSAT Area Coordinator.

FALL AO-13 TRANSPONDER SCHED

HR AMSAT NEWS SERVICE BULLETIN 314.09 FROM AMSAT HQ
SILVER SPRING, MD NOVEMBER 10, 1990
TO ALL RADIO AMATEURS BT

The transponder schedule for AO-13 is as follows:

Mode-B :   MA 000 to MA 095
Mode-JL: MA 095 to MA 125
Mode-LS: MA 125 to MA 130
Mode-S :   MA 130 to MA 135
Mode-BS: MA 135 to MA 140
Mode-B :   MA 140 to MA 256
Omnis :   MA 220 to MA 040

This schedule is expected to continue through 26 Dec 90.

The Command Stations have oriented the spacecraft to an attitude of:

BLON = 180 and BLAT = 0

AMSAT-OSCAR-10 has come out of hibernation and appears to be receiving sufficient solar panel illumination to support Mode-B transponder operations. The transponder may be used, carefully, at all points of the orbit except MA 254 - 006 when eclipses occur. If beacon or transponder signals show signs of FMing, users should cease all transponder use immediately.

Gordon Charrick wrote about sorry antenna supplied with IC-24AT. He is absolutely correct, it is sorry, but works great in areas where you have a strong repeater signal and intermod from pager services. It keeps out unwanted signals. But for weak signal work and out of band stuff you need a good antenna. I bought Japanese name brand: Maldol HS-702S from H.C. VanValzah Co. It is probably somewhat like the Diamond antennas others on the net have said they bought. When I put this antenna on the Ic-24AT I own, signals jumped up to full scale when before I couldn"t even hear them with the supplied dual band duck. It works great on all freq (including 870 MHZ and up). This antenna is flexible and 17" long. I Think I paid about $22 for it. I looked at the MFJ (too rigid) and the Larsen (too expensive) but after careful testing with three or four antennas, I decided the best all around was the one I bought. It is probably about the same as the Diamond (the diamond is $2 more). Whatever you do, I would not recommend buying an extended antenna that is not flexible. The first time you hit something with it you'll be resoldering your antenna connector inside the radio (no fun at all).

Dan "Sneakers" Schein writes
> I've just bought a MFJ-1278 -- and need a bit of help with it...

Dan, I tried to send direct to you but msg came back undelivered. I'll post here for you. I recommend you find someone with a manual and copy it. There are just too many commands to post on this net or to send a msg about. But here are some basic commands (if you are running MFJ-1284 Terminal Program, version 3.0)
Mode VP (packet)
Mode HP (hf)
Mode VB (VHF RTTY)
Mode HB (HF RTTY)
Mode VA, HA (ASCII RTTY)
Mode FX, FAX(CTRL F7 starts it)
Mode TV, SSTV(ALT F7 starts it)
To quit any mode back to CMD: hit F1.
Receive: K, Transmit: CTRL T (back to receive: CTRL R)
Hope this helps.   Try to get a book, you really need it.

Now when I lived in Denmark with my no-code licence I used to chat to Germans on 2M SSB. Many of them didn't speak English. Many of them, like me, didn't know Morris. So I learn't how to do the "You're Fahvenine Copenhagen -QSL?" routine in German. I got so good at it that sometimes the German station would come back to me and drone on for hours about the shack, the wife, the kids and the garden with me understanding about 2% of it.

Despite the problem of sounding too fluent I managed to fill the log book with Germans. I even crammed a few French stations in as well. When you get down to it. Knowing Morris QSO speak for the average contact is no different than knowing German, French, Swedish, Spanish QSO speak for the average contact. The only thing that ever threw me was the Swedish OFs that said something that sounded like "Al Verdanner Op" for CQ. But after hearing it a few times I caught on.

In most languages the CQ amd Q signal stuff is common. Some countries say "Come" some say "Go" for an over. But a couple of nights listening and it should become plain.

> How many of the licensed Russians (for example) know English well enough to
> converse over the air, pick out weak calls with non-standard phonetics etc?

Most Ruskies (certainly pre Glasnost) would only give name, sig report and QTH, with QSL via box 88. So even if you did speak Russian as some of my friends did, the chance of a "How's the wife?" QSO was pretty slim.

>

> probably can).

I certainly believe that you should learn enough of any language, even Texan, to be able to chat to the natives. If CW is the language of the HF bands, then a working knowledge will be helpful. And yes, if you want to work some of the more obscure parts, CW is a distinct advantage. Chances are, if you really want to know what the fries are like in the Ouagadougiou Wendy's you will have to ask the Burkina Faso station in CW. If English is not his language though, he may not understand the question and reply that it is "Not raining in Tokyo".

> help :-)

Now when I lived in Denmark, a whole bunch of local Danes used to sit on 14.20 and chat amongst themselves in Danish. I believe they have since moved. Every now and again an Ex-pat would call in and they would chat in Danish and log one more country. The appearance of a Danish speaking DX station was always written up - with QSL info - in the Danish Ham rag. But despite that, yes, HF is for DX and the local FM repeater is for local chats, unless you also use it as a phone patch to call foreign countries to set up HF skeds :-)

Rahul: these ideas have already been suggested, and in fact are considered by many to be reasonable and appropriate.

The elaborate idea of testing peole for each type if thing they get into, which in the opinion of some as simply be unnecessary, just won't fly with the FCC at all due to bureaucratic limitations (e.g. $$$).

While we still need to require code for access to HF, we don't want to do this is such a way as to require a lot of classes.

Here's what to do. Design a system of license classes. Make it meet these requirements:

1. CW required only for access to HF.
2. Specify which new class each currently licensed ham will be grandfathered into under your system. No one is to lose any privileges they now have.
3. Make sure there is an upgrade path from any class to any other class that has additional privileges.
4. All non-HF privileges must be earnable w/o being bundled with HF so that it isn't necessary to learn code to earn unrelated privleges.
5. The number of classes must be the absolute minimum necessary and under no circumstances more than 6. Fewer is always better.

Also consider:

6. ...no overgranting of new privileges by the grandfathering process unless there is some describable reason for it.
7. ...some degree of status quo on the HF structure for the purpose of not mixing up the issue of codeless access to VHF-up and the issue of abolishing incentive licensing.... if you can.

>Here's my modest proposal: provide (small) code-free [vsu]hf subbands.
>If they turn into glorified CB bands, then don't give them any more
>bandwidth. If they turn into real technology mills, then expand them.

My argument against this is that small subbands won't produce any usable results due to:

1. Subbands might be too small.

2. Semi-ghetto effect due to lack of contact with hams on the "main" subbands.
3. Duplication within these subbands of band planning done elsewhere and resultant planning/ccordination problems.

Would you set aside part of the repeater subband? The packet subband?
The DX subband? The experimental subband? The ATV subband? All of these?

NIMBY!!

>I work in a similar environment. One person here has been a factor in
>five people getting licensed. That's ~10% of the organization.

Maybe we need more people like that one person.

>>Sometimes people begin to get interested. Then they inevitably ask the

>13 WPM !

And what if they had NOT been hazed? Might they be going for 20 or even 35?

The CORRECT answer is "Morse Code is required of ALL amateurs for privileges
on HF frequencies by international treaty. Because the hams who are
interested in HF (and thus have frequent use and need for Morse) know
that learning code is easy, and to a great extent because they spent
a great deal of time learning it (even though it is "easy") they want
all US amateurs to do so, even if the prospective ham has no interest in
HF at all (heresy!)".

>For anyone who plays Tetris, or any of those video games, Morse Code is
>like making it to Level 5, 13, or 20. I've watched my wife spend hours

Big difference in tense here.

>"watering hole" I'm talking about. If you've forgotten where the watering hole is, then I hope you never have to talk to anyone there. i.e. I hope the mic and/or speaker on your HT never flake out when you really need it.

>I don't think the rules say "proficiency only when the test is given", but I've never tried to split hairs that closely. I don't think the FCC would yank someone's license if they've forgotten their code element. If that's true, there are a lot of OFs with sexy, short calls in serious trouble.

Also, it would seriously foreshorten the (already threatened) life of the Amateur Service.

I learned just barely enough code to pass the Novice and didn't need any more to pass the Tech. I presently have no interest in Morse Code.

I take it that what you mean is that each *HF* amateur that does not now know Morse Code at least knew it at one time and so could pick it up again. But of course this does not apply to VHF and above.

For a country the size of Kuwait, I'd agree. For a country the size of USSR or USA, HF is needed just to get to the other end. There are other

legitimate amateur uses of HF besides DX and contests.

--- SOLAR TERRESTRIAL FORECAST AND REVIEW ---

November 10 to November 20, 1990

Report Based In-Part from Data Obtained from the
Space Environment Services Center
Boulder Colorado

SOLAR TERRESTRIAL REVIEW FOR 04 NOVEMBER TO 10 NOVEMBER.

Solar activity has been low to moderate over the past week. Several M-class flares have erupted since 04 November. The first M-class flare activity occurred on 04 November with the eruption of a class M2.1/1B Tenflare with associated bursts of rich radio emissions. The emissions at 245 MHz peaked at 11,000 s.f.u., while 10 cm emissions remained confined to 330 s.f.u. The flare occurred at 17:41 UT from Region 6347 (S21E15 on 04 November). This flare had no terrestrial impacts. Activity has since fluctuated at low to moderate levels since 04 November. The most recent moderate activity occurred on 11 November when a class M2.1/SF flare occurred from Region 6361 (flare location: N10E18) at 04:36 UT. The duration of this flare was 56 minutes and did not produce any short wave fades.

Geomagnetic activity was unexpectedly quiet throughout much of the past week. Effects from a coronal hole never materialized as was expected early in the week. Perhaps the most noteworthy period of geomagnetic activity was the inactivity of 05 and 06 November. A-indices were way down on these days. The

A-index values at Boulder Colorado, for example, dropped to a value of 1 for 24 hours during this period. Recently, however, the geomagnetic field has become more active with periods of active to minor storming being observed at higher latitudes (as of 11 November).

Auroral activity has been practically non-existent this week over low and middle latitudes. High latitudes were also void of any auroral activity throughout most of the week. On 10 November, auroral activity became visible at high latitude and northerly middle latitude locations, but remained mostly of low intensity over middle and many high latitude locations.

Radio propagation conditions have been normal to above normal over the past week, with fair to good propagation over high latitudes earlier this week and good to very good propagation over middle and low latitudes throughout most of the week. Propagation became somewhat degraded over middle latitudes on the evening of 10 November, but has since improved to normal or better conditions (as of 11 November).

SHORT TERM SOLAR TERRESTRIAL FORECAST

Solar activity is expected to remain low to moderate throughout the next week. Region 6361 (N08E04) which has a Beta-Gamma magnetic configuration, is very capable of producing several more M-class flares. This region has been the site for most of the flare activity. It has produced numerous subflares. Most of the activity has been observed to occur just north of the leader spots. This regions' beta-gamma configuration increases the chance of witnessing a major flare. Current flare probabilities for the next 72 hours follow:

Flare Type	24hr	48hr	72hr
Class M:	50%	50%	50%
Class X:	05%	05%	05%
Proton Flare:	05%	05%	05%

The potential for a significant proton flare is small and has not changed the PCA alert condition. No PCA's are expected from the regions currently visible on the solar disk. The 10.7 cm solar radio flux should begin a gradual decline over the next week, barring any significant growth in Regions 6358, 6361 and 6364. The preliminary solar flux peak for this week occurred on 07 November with a peak flux of 215, which was within the predicted range for this solar rotation. The current sunspot number for 11 November is 274, and is also expected to begin a gradual decline over the next week.

Geomagnetic activity is expected to remain mostly quiet to unsettled over the next 72 hours at least. Activity may become slightly enhanced on 15 or 16 November, but is not expected to reach storm levels. Conditions should remain predominantly quiet to unsettled at low and middle latitudes. High latitudes should remain mostly unsettled throughout the coming week.

Auroral activity will not be visible from low and most middle latitude stations this week. High latitudes may witness periods of low auroral activity, but such activity will not be too common even at high latitudes.

Radio propagation conditions should remain similar to what they have been like over the past week, with normal to above normal propagation over most paths. There is a moderate risk of short wave fades (SWF) and sudden ionospheric disturbances (SIDs) over the coming week on the sunlit hemisphere of the earth. Potential flare activity may produce SWFs and SIDs, particularly if Region 6361 continues to exhibit a beta-gamma configuration.

SUMMARY OF ALL ACTIVE REGIONS VISIBLE ON THE SOLAR DISK AS OF 11 NOVEMBER

    | Geomagnetic Field |  Thu.  |  Fri.  |  Sat.  | Sun.|  Anomaly   |
    |    Conditions     |    Given in 3-hour intervals   | Intensity  |
    |_________________________________________________________________|
```

NOTES:

This graph ONLY depicts geomagnetic conditions observed at Boulder, Colorado for the past 87 hours. Conditions to the north of Boulder will generally have slightly higher activity than Boulder, while conditions to the south of Boulder will likely have lower activity than those depicted here. However, the plots should present a good approximate average of planetary geomagnetic conditions.

"Anomaly Intensity" is meant to represent nothing more than a very rough guide to the --potential-- interaction geomagnetic fluctuations --might-- have on earth-based systems sensitive to magnetic fluctuations (ie. electrical power distribution networks, telecommunications networks, etc.).

For radio signal propagation purposes, plot lines are approximately proportional to propagation quality when plot lines are below Minor Storm conditions. Propagation quality may deteriorate rapidly (ie. non-proportionally) when plot lines reach or exceed Minor Storm levels. Complete radio blackout conditions on all short-wave frequencies may occur if plot lines reach or exceed Severe Storm levels.

PLANETARY 10-DAY GEOMAGNETIC ACTIVITY OUTLOOK (11 NOVEMBER - 20 NOVEMBER)

NOTES:

Predicted geomagnetic activity is based heavily on recurrent phenomena. Transient energetic solar events cannot be predicted reliably over periods in excess of several days. Hence, there may be some deviations from the predictions due to the unpredictable transient solar component.

NOTES:

Latitudinal boundaries are the same as those given above for radio propagation quality. Periods of high auroral activity may be suitable for auroral-propagation. Locally visible moderate auroral activity will almost always cause moderate to strong deterioration in HF signals, while locally visible high auroral activity will render most HF bands useless.

Auroral activity is defined as follows:

NOT VISIBLE: Not visible

LOW: Diffuse, inactive auroral activity visible very near the northern horizon for mid and low latitudes.

MODERATE: Visibly active, but not exceptionally bright auroral activity most visible above the northern horizon for mid to high latitudes. This type of activity usually encompasses torch-like (or beam-like) aurorae mixed with low-intensity curtain aurorae.

HIGH: Visibly very active, with periods of bright, pulsating curtain aurorae possibly mixed with moderate intensity zenith aurorae. Can occur to the north as well as stretching up near the zenith, particularly at middle latitudes. There may be some color fluctuations discernable.

VERY HIGH: Very active, very bright and very colorful auroral activity possibly mixed with intense zenith and curtain aurorae. Visibly strong pulsations with auroral boundaries to the zenith, stretching even partway to the southern hemisphere of the sky.

EXTREMELY HIGH: Rare, incredibly bright auroral activity with rapid color and brightness fluctuations mixed with very strong rapid auroral pulsations visible throughout the entire sky.

There are three plotted lines per day in the auroral activity prediction charts. Each of these three plotted lines represent three periods during the evening/morning when auroral activity can be seen. The first line represents the evening twilight period. The middle line represents the --local-- midnight sector, while the last line of each day represents the morning twilight period.

The auroral activity predictions charts are heavily based on recurrent phenomena and may not be accurate in the longer-term due to unforseen and unpredictable transient events (ie. such as solar flares).

The visibility of auroral activity depends on your location and the brightness of the sky (which is dependent upon both city lights and lunar phase). These charts do not account for these variations. The charts are based on dark-sky conditions (lunar phase excluded). Aurorae occur independent of sky brightness, so just because auroral activity may not be directly visible (due to lunar phase, for example) does not mean auroral activity isn't in progress.

As it says in the header, I need to find any and all printed info on the Kenwood R-300 receiver. This radio is a shortwave receiver. I am going to purchase a used one for $75 from a friend of mine, but it comes with no paper. I'm looking for an address or phone number of a place to order every shred of printed matter on this thing, all the way from user's manual to schematic and theory of operation (if such a thing exists). Also, if you know of any user modifications that can be done to this model, please let me know about them.

** End of Quote **
Not entirely true! The RULES still prohibit control of a repeater using the
freqs below 220.5Mhz! ONLY 220 and 440 rptrs may be controlled on their
inputs! A 2m machine or lower may not be because an auxillary station may not
control another station ( the rptr) below 220.5....and that hasnt changed.

** End of Quote **
The downtilt problem is for those who are on a 1000ft or higher tower/mount,
etc and live in the shadow of such...for systems on 500ft or similar towers,
no downtilt is necessary....here in Houston several rptrs are using the
Diamonds...yes they do make a MONO band UHF antenna (get their lastest
catalog!) I would also suggest NCG and the Comet line they carry! Excellent
antennas! I am using their short dualbander (2X4FZ) and it is a good performer
for the price! (about 120)

anyone with mods for the Yaesu FT711RH please get ahold of me either by
Fidonet Matrix or write to my PO Box below...
I am looking to expand coverage down to include the 420 range if possible!
(We just joined here and I assume the rules are similar to the Fido ECHO about
posting mods?) Tnx and 73

I accidentally discovered a swapnet on 3898KHz Friday evening at 0130 UTC. I
was wondering if anyone out there knows what the actual hours of operation are
for this swapnet and if anyone knows of other frequencies and times of
operation for swapnets? I found it very interesting and helpful even though
I am not a ham--it seems everyone gave their phone numbers out so that persons
without a transmitter could still participate.....

I realize that there is no likely hood of this ever getting as far as the FCC for consideration, but what is wrong with a KISS license plan??

Example:

CLASS	(Old Class)	Priveledges	Requirements
C	(Technician)	All modes full power above 30 Mhz.	No CW -- Comprehensive technical exam.
B	(General)	All modes - all bands Power restricted to 250 watts.	5 WPM CW -- Comprehensive technical exam.
A	(Advanced)	All modes - all bands Full power.	Hold a Class B license for 2 years.

The way I see it, it keeps the paper-work simple for the FCC, provides an entry into Amateur radio for both CW and non-CW interests and has only one down side. By doing away with incentive licensing, there will be no higher classes to look down their noses and the lowly masses.
One argument I see is that there is no guarantee that a Class B license holder will use his 2 years to gain the experience that is necessary and is the only reason for having the restrictions on the Class B anyway. In fact, if a Class B user does just file his license away and never use it, I would think it highly unlikely that he would magically develop a renewed interest when he automatically became a Class A. I also think that the 250 Watt restriction is meaningfull when you consider the avaerage power of a commercial bare-foot rig today fits that class perfectly.

Any comments?? Should I actually write this up and propose it to the FCC?
Should I don my NOMEX underwear??

Hello all you in netland,

Terry Northup, editor of COMMUNICATIONS QUARTERLY, has just sent me a list of articles scheduled to appear in the premier issue. The following is a copy of the text of her fax. In my narrow mind :-) this looks to be a real good start for her project. You can contact COMMUNICATIONS QUARTERLY at this address:

CQ Communications, Inc.
COMMUNICATIONS QUARTERLY
Terry Northup, Editor
Main St.
Greenville, NH 03048 USA

Phone (603) 878-1441
FAX (603) 878-1951

If you like what you see, please let Terry and the other people know, the best way would be to send in a subscription.

---------------------Letter Follows----------------------------------

Hi Ron: Here's a list of the articles which will appear in the premier issue of Communications Quarterly. Thanks for your help in getting the word out to other hams who might be interested. The first issue has gone to the printers and first copies should be out by the end of the month.

73,
Terry, KA1STC

Communications Quarterly
Editorial Schedule
1990

NOVEMBER 1990

WD4EUI	Interface Your Computer to the "Poor Man's Spectrum Analyzer"
N6NWP	High Dynamic Range Receiver
WB1ALZ/N2BU	A Communications System using Gunnplexer Transceivers
WA1SPI	S-Parameters
G2HCG	The Enhancement of HF Signals by Polarization Control
W6FR	Telephome Susceptibility to RFI
K1FO	432-MHz EME
Carter	Super Narrowband Techniques
NU1N	DSP: Working in the Frequency Domain
W0JF	The 5/4-Wavelength Dipole
K1ZJH	Transmitter IMD Measurements on a Utility-Grade Spectrum Analyzer
KB6IC	Error Correction in Data Transmission
W4MB	Using MININEC for Antenna Analysis

One thing I have to note after reading this is that there seems to be some good coordination of articles, there is some interrelation of the articles. Note how DSP and narrowband work can work together as can the spectrum analyzer articles. MININEC antenna analysis and the polarization control articles are a nice combination also. The combination of theory and practice is a real good touch.

You can e-mail me your comments, I am going to collect them and forward them to Terry.

73 and happy reading,
Ron Todd, K3FR

disclaimer: I am in no way connected with Communications Quarterly or with CQ Communications, Inc. I am doing this on my own hoping to further the practical exchange of Amateur Radio related technical information.

Hi...

I'm posting this question for a hang gliding friend of mine, who has recently become a ham (Dave - N3IBY). PLEASE respond directly to my mailing address, if possible, for I have spotty reception of this mailing list. I will post results/comments, if need be, back on the net.

tnx... andy ka1gd

zwirko%v5120.decnet@ccf.nrl.navy.mil

....

Is there anyone out there who has received WEFAX off the geosync satellites?

According to the Handbook, there are several satellites which broadcast WEFAX on, or around 1691.0 MHz. Also there seems to be some wx transmissions (WEFAX?) on 137 MHz. Does anyone know the details of any of these transmissions, ie. mode/modulation scheme or hours of operation? Has anyone successfully copied WEFAX on 137 MHz or 1691.0 MHz and if so what receiver/downconverter/radio/ant were used and where might I find more information? I am interested in both kit and off-the-shelf units. I have also seen varying amounts of software for the KAM, PK232 and other all-mode digital boxes, which claim to save and display data on PC's. Does anyone have any experience, or comments regarding these types of products.

Any help would be much appreciated! Thanks.

I'm sorry, but I believe my message has been completely misunderstood. I would GREATLY appreciate receiving the keplerians in 2 line format, it's the FORMAT DISCRIPTION that I believe most people have already seen and

copied(if interested). Maybe there's something wrong with my host computer's
net connection, but the last month I have not received any Keplerians, only
a DISCRIPTION of the 2-line.

In short, it's the 2-line KEPLERIANS I would appreciate receiving.

And, yes, Thanks, Mr. Kelso for the work you've done in providing these
keplerians, I just wish you didn't stop.

But.... why even have it in the first place?

What does the existance of the requirement tell the brilliant mind about
the attitudes of ham radio?

Which is the worst attitude problem:
1. Not getting into ham radio because of irrelevant requirements.
2. Continuing to have irrelevant requirements

(The question applies ONLY to privileges above 30 MHz)

>If the HF Olde Phartes want to be masochistic, let them. You don't need
>13 or 20 CW for getting the bands needed for some cutting-edge work.

But they are also being sadistic as well, with these requirements.

>My personal opinion is that Hams haven't worked hard enough at promoting
>what the Amateur Service provides to the brilliant minds - a personal
>playground at real power levels and bandwidths. We have not shown how
>computers can "marry" radio, with interesting results.

And when will they? We've had years to do the promoting. I've tried,
and just cannot justify it because of the damned Morse Code requirement
that keeps coming up.

>Besides, computer hackers can make more money in their spare time by
>hacking computers than by using _Amateur_ (read "non-profit") Radio.

This is the perception.

In terms of information to spectrum ratios, CW needs to be that narrow
to justify its low information rate.  And it CAN be that narrow.  It's
just inconvenient to the human.

Less spectrum is also not necessarilly better, either. Ham radio growth
is nowhere near the growth of other services. They need OUR spectrum.

So maybe America *IS* fat and lazy. A Morse Code test isn't going to
change that. The lack of one might. Get someone into ham radio that
would not because of the test, and they might get interested in one of
the technical career areas, and they might start learning and working
on something and quit being fat and lazy.

If 5 WPM is ridiculously easy to learn, what good is the test at all?

Hey, that makes sense! Pass the minimum 5 WPM for access to HF, and
then toss increased speed into the whole question pool. That way one
who is more technically inclined can upgrade that way, and one who is
more operator inclined can upgrade that way.

But are we allowed to have anything that make sense in ham radio?

No one says that everyone has to be interested in everything in ham radio.
There is *NO* mode that interests, or should be expected to interest,
everyone with a ham radio license.

But I do know some "old timers" who are into packet radio, such as W9CD.

Maybe you can argue why we should not, but in the USA we ahve subbands where it is not legal to use voice, and us VHF-er's are proud to sport (well maybe some of us) the ONLY TWO CW ONLY subbands in all of ham radio here.

The point is that if your CW is no good, you probably cannot make a good legal ID unless you do it by machine. But this is just sending skill. One can probably send a legal ID at 1.2 WPM anyway. I've done slower than that (in 2m).

Yeah! But at least HAMS have to some extent, as we don't have a
260 foot band. (80 meters)

So, are you saying that all automatically controlled 2 meter repeaters
with an autopatch are not legal?

The control would have to be either AUTOMATIC (which you say is not legal)
or would have to be REMOTE, which requires a control link on an AUXILIARY
frequency, which does not include any portion of 2 meters.

 I checked this week two ICOM HTs.
2SAT with serial number 7021, and 24AT with serial number 2488.
```

Both are "opened" for receive as appeared on the net, but both
have an offset only in 25KHz steps. So for example I cannot program
them to receive on 145.600 and transmit on 145.010 (580KHz offset).
Is it a bug on those HTs or it can be solve by some modification?

The answer to the mystery is that a dipole 1/2 wave long is not
resonant! The formula for an exact halfwavelength is

halfwavelength = 492/frequency in MHz.

The widely published formula for a dipole antenna is

l = 460/frequency in MHz.

Jim's explaination of the physics is as good as anything I can offer.
The practical result is that the wire must be cut a little shorter to
get zero reactance at the feedpoint. This is even before you do any
adjustments for the real world objects like houses which may be near
your antenna.

I don't think so. I believe you must have a special service license to modify a radio that opperats in the CB spectrum. On the other hand, I think you could modify a CB to work in the 10 meter band, because then it wouldn't be a CB radio anymore. I also think the FCC could care less in either case.

Tad Cook:

> Phil has obviously never worked CW outside of the lab, using REAL ham
> gear in the REAL world.

How do you think I got my Extra? (Hint #1: I earned it in 1973, well before I had a personal computer. Hint #2: when I was active in Field Day, most of my operation was in - surprise! - CW).

Mark Zenier:
|> And he multiplied where he should have divided.

|> The bandwidth needed to send a 20 WPM Morse signal is about 17 H.

Yeah, looks like I did. But my BW figure of 24 Hz is probably closer to reality since you'll need some "excess bandwidth" over and above the Nyquist requirement in order to time the beginning and end of each symbol accurately. Yes, CW (or any digital signal) can be sent in just the Nyquist bandwidth. But if you do, the intersymbol interference goes to zero at only one instant in the middle of the bit, and there will be a LOT of jitter in the zero crossings between the bits.

Depending on how you recover bit timing at the receiver you may not care; the Coherent CW stuff will work fine with the smaller bandwidth as long as the receiver's bit element clock is properly synchronized to the transmitter's in some other fashion. If you want no jitter at all in your zero crossings, you'll need 100% "excess bandwidth", or twice the Nyquist bandwidth. That's 33 Hz for 20 wpm. Real synchronous digital modems typically operate somewhere between 0 and 100% excess bandwidth, depending on how they recover clock.

And, of course, all this assumes that you have stable, phase-linear filters - which nobody without DSP is likely to have.

Anyway, the original point of all this was to correct - once again - the mistaken notion that CW is somehow more "bandwidth efficient" than any other mode. Whether you use 17 or 33 Hz, both numbers are a lot smaller than the 400 Hz bandwidths of most real CW filters.

Phil

Has anyone had any experiences, good or bad, with Diamond antennas for repeater use? The repeater is on 440, and from what I can tell in the Diamond catalog, the only 440 antennas they make are actually dual band (2 and 440), but seem to have excellent specs considering the cost when compared to other commercial antennas.

Any other budget-minded suggestions for repeater antennas? Stacked dipoles, homebrew multiple 1/2 wave element collinears, and G6's have already been thought of.

Also, anyone know of a good source of fiberglass tubing for vertical collinear homebrewing?

Minor quibble here: an auxiliary station is only one way of providing remote
control. I know of at least one open autopatch on 2 meters that ran with two
phone lines, one for the patch and one for remote control...

Will 40 watts really allow you to "talk some skip" better than 25 watts?
In my car, I use either an IC-735 (100 watts) or a converted Cobra CB.
(10 watts)  It doesn't seem to make much of a difference.  Perhaps it
would for local communication, but not when the band is open.  Power does
not seem to be as much of a factor on 10M as on other bands.

Open-wire feedline is lower loss, and is cheaper if you make it yourself.
It would require baluns at each end or tuner.

FCC no longer gives tests for the ham licenses. This is now done by
volunteer examiners who are certified by several national Volunteer
Examination Coordinators (ARRL is one.) Best bet is to find a local
ham who can help you out. I bet there is a club at UCSD. If you can't
find it on your own, write ARRL, 225 Main St., Newington, CT 06111
(the national ham radio society), and they can send you the address
of a local ham club.

>   should be white. Am I correct?

Yes, I think so.

>2. What should the finish look like
>   on the inside chassis and the transformers, etc.?

Modern chassis's are made of aluminum, but some antique models use steel or copper-plated steel. These tend to get badly tarnished.

>3. Whats a quick way to clean the metal
>   surfaces inside the cabinet?

The QUICK way is the "total immersion" technique. You remove all the tubes, plastic parts, dial cords, and other breakable items. Then you dunk the whole radio into a tub of warm, soapy water and scrub with a brush until clean. Then you rinse it out VERY thouroughly -- you want to make sure you don't leave any soap residue inside IF transformers, etc. Then you shake out all the water you can and bake it in the oven on lowest heat with the oven door slightly ajar. Leave it in for a long time until you are sure all the water is evaporated from inside all permeable components.

I have done this before with old radios, and it worked like a charm. I have heard that there is danger of washing away the lubrication in the bearings of potentiometers and variable capacitors, but I expect that a radio this old probably doesn't have much lubrication left anyway. There are lubricants you can buy for this purpose if it worrys you.

If my usage of this news group was being paid for by anything but funny money (money allocated by department for computer use and will be lost if not used) there is no way I would waste it on these flames on flames of flames. I deeply respect the rights of individual free speech and all the bill of rights including the second one. On the Second Amendment I disagree in that I believe gun control can control crime. You simply make every one wear one. The gender pronoun flap is ridiculous on this form. If I wewr to add a few comments about the KKK, ARRL, NAACP, NCAA, Pete Rose, mother and the American flag, Everyone would have a target for their flames..

Since we seem unable to restrain our flames I propose the following FOF (Flaming Old Farts or Flames on Flames) reports ranging from 10 (absolutely for) to -10 (I'll die before I will). Just send the subject line delete the rest of the msg and add your FOF report and call.

FCW   10 I'll fight for cw from the grave.
     -10 if every one who ever used cw disappeared from the face of the earth the world would be a better place.

FSX   10 Women are obviously superior & should be worshiped as divine goddesses.
     -10 Keep 'em pregnant in the summer time and bare foot in the winter.

F38 10 You can have my gun when you pry it from my cold dead hand.
     -10 Rob me, rape me and kill me I wouldn't dream of defending myself.

FOF 10 I agree 100 per cent with your opinion and I nominate you for the FOF hall of flame.
    -10 You are obviously retarded, likely harelipped and your girlfiend probably says baa when she gets a hair cut at the local CB store.

We can then just average the FOF reports and have a numeric consensus of the mood of the group on specific subjects.

Please email me your ideas of FOF reports and I will make a final report of the collection to the news group.

Gordon Couger N5QAQ

If you have remote control, you have a control operator at a control point
(required by 97.109(c)). If the remote control link is by phone line, then
someone has to be there controlling it. This won't work for an unattented
repeater (automatic control) by a user who can't call it up on the phone

Why call the repeater to make an autopatch, just call direct. Or is it
long distance?

Okay, it's four days later, but I'm still basking in the afterglow. I spent 24 hours working the CW Sweepstakes this weekend, and it felt *good*.

I operated from the West Valley Amateur Radio Assn. club station in the Monte Sereno Red Cross office, using my own call. The equipment was a TS-830S, my ancient AEA CK-1 keyer and bencher paddle, a pair of hi-fi Sony headphones that lost all their foam during the contest, a tribander at 30 feet and a couple of dipoles. Perfect SS station! :)

From Class A, my final tally is 792 QSOs, 76 sections.

Highlights:

Having so many folks say "HI MOJO" and "GUD TO C U ON THE AIR" from people I didn't know (or think I knew)!

Working K1ZZ and W1AW in the first couple of hours.

Spending an hour on the 15 meter novice band running novices steady for 32 QSOs. Hardly a single break! Running 18 wpm on the keyer, and those guys were fun! There were certainly a lot of 2x2 and 2x1 calls among the crowd! It was a fantastic way to spend a slow time on Sunday afternoon.

Being called by WP4IXI during that run to pick up Puerto Rico for my 76th section!

Lowlight:

40 meters was awful from this station! Couldn't be heard worth a darn. Maybe I'll look into the antenna a bit. Any suggestions? Maybe an eastern-pointing sloped dipole?

I'd love to think my 792x76 would be good for a certificate in A class, but I know that the competition in SCV is mighty tough. I'm almost chicken to ask around and find out who beat me. :)

I am thinking of building a 5/8 over 5/8 2m colinear. I have all the parts required and am thinking of placing it all in piece of PVC 2 inch diamemter waste water pipe. This will keep it rigid and will produce a nice looking design.

I am not sure however on the RF attenuation produced by the plastic pipe. Would anyone out there mind telling me the attenuation properties of such a pipe and some discussion of the attenuation properties of plastics at all frequencies would be interesting. If no-one has the information to hand could someone please point me in the direction of a book that would.

Thanks in advance.

>> luru@stekt.oulu.fi (Ari Husa OH8NUP) writes:
>> What's the point in having a dozen repeaters in a questionable QTH (and limited range) in comparison to ONE good repeater in a high (broadcast) tower or similar?
>
> Capacity. A dozen repeaters with more local coverage may support a dozen short range QSOs while the one wide coverage repeater would occupy the frequency in the entire geographical area while carrying only 1 QSO.
>
> Many areas of US now recognize the need for a mixture of local repeaters and wide area repeaters. Users are encouraged to use the local machines unless they really need the range of the wide area machine.

Too bad the idea of using a repeater is slowly being inculcated into our collective consciousness. Whatever happened to simplex?

I heard an ongoing conversation on a nearby wide-area coverage repeater the other day between a regular long-distance (250 miles) "commuter" and a traveller passing through town. Our commuter type has a history of tying up wide coverage repeaters for literally hours at a time, so it came as no suprise that I was listening to yet another instance of it.

Here, he was separated from the other station with whom he was conversing by ONE CAR on the highway. They were 20 feet apart and talking through a clear channel repeater over 20 MILES away!

When he asked what the frequency of the next repeater down the line would be, I jumped in and sarcastically added "146.52".

He matter-of-factly requested "What's the offset?".

I just reached down and turned the radio off in disgust.

>....

Jeff, on my repeater, I have tried two of them and a dB products...

the HD500M (?) had 8 5/8 wave in phase, and had about the same gain as the dB products antenna...
I now use a X700M (?) which has 11 elements, 5/8 wave each on 440 MHz, and it seems to be the superior one (costs about twice as much, etc.)

two complaints about them which the dB products doesn't have...
1) they use UHF connectors; I prefer N types at that frequency...
2) being non- rigid, many users experience fading as it "whips in the wind" altering the radiation pattern compression.

the average user accessing my repeater prefers the dB products...
so why am I using the others? Wind loading... in a 60mph +++ blast we had this summer, it loaded my 2", 1/4" wall mast enough to bend it!!! this caused some tower work to replace the mast, and I figured the "flexing" of the fiberglass was better than replacing masts... thoughif I had replaced it with a thicker wall, or a steel mast, it would have been fine I suspect.

If I had a taller tower, and could side-mount the db-products one, I would have done it.

You mention cost... well, a 8 element db products does cost more new than the diamonds, but.... I have to admit, I paid about 100 buck more for the x700m than I did a perfectly good used dB products job...

So, I recommend looking at whether you NEED flexing, less wind load, and then choos accordinly, not overlooking the possibility of a good used dB products

antenna... many police departments, etc. are replacing their old external
phasing harness ones with the new fiberglass jobs, and they can be had very
reasonably, and are EXCELLENT.

Antennas and coax are the worst place to skimp on in a repeater installation
(mayby not so humble opinion).
good luck

This might be a dumb response, too (I'm not exactly sure what you mean),
but 10 meter FM is a whole lot of fun, especially through repeaters ... it's
a whole different type of QRM and QRN that, to many people's ears, is just
as much fun but without the "SSB Headache" I get after a few hours of
over-used speech processing and tin voices.

I wonder if any of these FM radios allow you to work "splits" for repeaters. I have heard many stories about eliminating the "skip zone" by using repeaters - sounds like fun!

15 meters is my favorite HF band. (I reserve the right to change my mind about this depending on propagation from month to month :-)).

Why isn't there the equivilent of a 2510 for 15 meters? Or, is there one that I don't know about? Seems to me it wouldn't be that much harder to build than the 10m one, and you could leave off the FM portion and just leave CW, USE, and LSB (packet)

Anybody know anything about NCG attempting this back in the early 80's?

 ^^^^^^^^
```

I am ONE (at least I was the last time I checked :-) and the code requirement is keeping me from becoming a ham. I'd love to become a ham, I can answer the theorie questions up to Advanced without having to memorize the answers, I used to operate modified ham equipment on the CB band in France, back when provincial French CB was populated with reponsible/technical people, when CBers where invited at the local ham club meetings, etc.. (I am retricting this comment to the small area of France where I lived in at the time. I stopped using CB when it got spoiled by frustrated people) So I think I can be a "qualified person".

I have little time for my hobbies and therefore I am very carefull and selective about what I spend my time on. I do not find any use for CW right now, nor do I have time to learn it (even 5WPM) to get a novice license. However, if I had a no-code license I could someday be interested in CW and learn it "on-line" with friends on the bands and with a meaningfull purpose: TO COMMUNICATE.

I speak 8 languages and always found it easier to learn them while in a communication situation. I did not speak Japanese before going to Japan, after one month, I was getting by (more than 5WPM ;-). I had tried to learn Japanese prior to this experience with no success, because I was not motivated by a COMMUNICATION need. Of course if knowing Japanese was required to enter Japan, I might have never been to Japan, I might have never learned Japanese. A great loss to my Japanese clients.

I felt that I had to add the this already too long thread (count there a vote in favor of rec.ham-radio.tech) because I did not see any comment from the non-ham side, people who would like to become hams but are kept from it because of the code requirement. Sorry if you feel this is a waste of bandwith.

The experience we've had with the DIAMOND 2M/70CM antenna has been somewhat mixed. Some good, some bad. From an RF point of view this beast is a great antenna--we haven't seen the fading you describe--even in the worst winds.

We had had a *serious* problem with the mechanical arrangements on the thing the *entire* antenna is supported by this 8cm long casting which slides into the aluminum mast mount. The problem is that there's only 1 bolt that attaches the mast-mount to the casting. In even moderate winds, the stress on this 1 bolt is enourmous, with the result that the aluminum mast mount gets chewed to bits. This causes some intermittent RF problems, because the N connector is "grounded" to the casting with the assitance of this single bolt. We're re-drilling the cast with two more holes, tapping them and using another pair of bolts to try to reduce the stress on the mounting system.

COMET makes an antenna similar in electrical characteristics to the DIAMOND. We haven't actually put it up yet, but it seems to have a far superior mounting arrangement.

I am looking for any information (i.e. schematics, manufacturer address, mods, etc...) for a BELCOM LS102. I think this equipment was build in europe. It is a mobile 10M tranceiver AM,FM,USB,CW with 10W output. The local ham shops have never heard of it.

The equipment has been modified to operate on additional frequencies, however, when doing so they removed the CW key input, and did other weird things to it. I need to tune the transmitter (with a dummy load as I don't have a license) and use it as a receiver untill I get a license that allows me to use it in transmit mode.

Anyone with information should e-mail directly.
Thanks.

ENGINEERING ASSISTANCE NEEDED:

I am trying to get an engineering drawing for a telescoping tubular
tower manufactured by the now defunct Wilson Systems Inc.
formerly of LasVegas Nevada.

I understand that this was sold to "TRISTAO"something....
but info on them is scarce.

Any ideas? The city is giving me lots of grief on stamped drawings
(in addition to other things) and a drwaing would be alot easier than
sawing off a sample of each tube and paying for metalurgical studies.

TNX de WA8ZHN / PRBWON: still fighting.

Bob West asked for a definition of tomorrows amateur radio operator. Here's my 2-cents' worth:

Amateur radio will continue to be a RADIO hobby. It will welcome all individuals who have enough interest in radio to learn about it. It is broad enough to accommodate many interests; from CW to spread-spectrum; from 1.8 kHz to 180 Ghz. Amateur radio should not evolve into a group of special-interest factions, each with its own agenda. Instead, it must accept the many broad interests as equal in stature with the rest.

The individual amateur should be knowledgeable about amateur radio, and that means its beginnings as well as its present. Testing will continue to cover all modes and privileges that the amateur radio operator will receive with the granting of his license. There should be but two classes of license: the entry level, and the full-privilege license. Entry level Hams will have a basic knowledge of the hobby and its history; know what the band limits, power restrictions and operating rules and practices are; understand simple electronics principles and electrical safety; and be able to copy the Morse code at 5 WPM. Entry-level licensees will be able to operate any mode that the technical requirements of the exams (TBD) cover, and on any band, with power restricted to 200 watts RF at the transmitter antenna terminal.

The full-privilege class exam will be similar to the old FCC second-class with radar endorsement in complexity, with added provisions for the current modes of operation and state of experimentation. The holder of this license will know something about every aspect of amateur radio. This class of license will also require copying 5 WPM of Morse code. Power limits will be extended to 1.5KW, and an additional segment of each band will be reserved for the full-privilege holders.

An entirely new hobby class should be recognized by the FCC: that of the computer hobbyist whose only tie to radio is to use it as a substitute for wire links between computers. Rules and requirements for this service should be developed by the computer hobbyists, not radio enthusiasts.
A portion of each band above 30 Mhz would be set aside for this hobby.
The new service would appeal to those who either won't or can't meet the license requirements of amateur radio, but who may be able to contribute to the science of communication in some other way. Current holders of Ham licenses would be required to meet the new license requirements, and vice-versa, if they desired to operate in the other bands would nee(service).
Under this concept, a person would need a separate license for each service if they intended to operate in both.

Equipment used would have to meet a TBD set of acceptance standards issued by the FCC if its purpose is to emit RF energy, and the output power is greater than 50 watts. At 50 watts and under, no type-acceptance would be required, but the user would be responsible for certain technical aspects of the emissions.

I realize that the new hobby class is not amateur radio, but I do think that there should be provisions for this variation of the radio hobby. It would be up to the present computer hobbyists to organize themselves into a national charter, similar perhaps to the ARRL, to define itself and liaison with the FCC to get it in place.

There is room for data-stream transmission in amateur radio, just as there is room for SSB, AM, FM, CW, etc. Practitioners who desire the privileges of a radio hobby should be willing to meet its requirements, regardless of how they plan to communicate. Under the new service, there presumably would be room for FMers and CWers, provided that they were willing to conform to the rules and requirements of that service.

Amateur radio enthusiasts will continue to provide emergency communications on their assigned bands while operating as Hams. They will continue to pursue contesting. They will continue to perform community service functions as before, and they will ALWAYS be ready to help the new, inexperienced person to get into the hobby, and to increase his/her skills once in.

> over-used speech processing and tin voices.

Being a lowly tech I haven't worked 10 FM directly but the Worldnet repeater system here has a 10 meter node. Through 440 I have worked many countries and most states either mobil or with an HT.

I want to throw in a plug for the use of PL (CTCSS). There is an ARRL plan for 10 meter PLs based on the reqion where the repeater is located. This would reduce significantly the amount of QRM caused by bringing up 3 or 4 repeaters in different parts of the world and would allow much better QSOs.

Me too! I also remember the "negative reinforcement" method of radio education... Like the time I left the 600V power supply open on the floor of my room, came back from supper (the lights were off), and _STEPPED_ on the thing in my bare feet! OUCH!

Then there was the time that I learned that with a full-wave center-tapped rectifier circuit, the ENTIRE PEAK VO
LTAGE of the transformer is across each diode, every half cycle. In this case it was a 1000V, 1/2 amp supply for my four-sweep-tubes-in-an-arc5 linear.... One of the diode stacks shorted out, and every light in the house blinked at a 60Hz rate. Nice effect, until the house fuse blew....

>>> Re "Microwave and RF Forum as a mailing list/newsgroup

I'd really appreciate it if this were possible. I tried to send some mail to (I think) Jim Grubbs on Fidonet but it was bounced (even using the REPLY command from the Usenet reader :-).

From New Zealand, Fidonet access via phone (I'm guessing - we don't have it here) would be cripplingly expensive - like a choice between reading the group and eating :-), whereas Usenet and Internet mail are already available.

To Summarize: One (informal) "Yes" vote for either a mailing list/newsgroup.

Cheers
Giovanni - ZL2BOI

There are still plenty of chassis made of steel, which is cheaper than aluminum, and gives a better ground. Aluminum reacts with the screws and ground lugs, forming a white dielectric film.

>

I have used this technique... with really old and gungy radios it's really the only way. But I did it without soap, so there was no residue to worry about. Just take'er out front and have at'er with the garden hose and a toothbrush....

Then, instead of sticking the poor baby in an oven, I take a ventilation fan, the kind you put on the floor on a hot day, point it straight up, and set the radio on top of it. I then leave the radio drying for about a day. This won't work if you have a power transformer in there, especially a high-voltage one, as I found out one day, when I fried a perfectly good DX-40 transmitter. I should have used the oven on that one. But with the oven, you have to be quite careful, not to generate enough heat to melt any plastic dials, etc....

One ham I know regularly uses his dishwasher for this purpose, instead of
scrubbing by hand. It works very well, he says.

If anyone on this net really said this crap, there would be the universal sound of raspberries from all corners. Either you misunderstood, or I missed something.

TCP/IP on 220 is a noble persuit, and you only had to endure 5 WPM of an antiquated modulation method to be able to do it. I could be only more impressed if a Novice was doing it. Go forth and be brilliant.

The current ARRL DXCC country list follows. Changes from the previous posting (3/90) include the deletion of Y2, 4W and 7O, the addition of the new 7O, and other minor modifications.

Much of the information was provided by Ron McConnell, W2IOL.

The colon-separated fields are:

1. primary amateur prefix ("*" suffix for deleted countries)
2. country name
3. continent

4. ITU zone(s)
5. CQ zone(s)
6. time zone (hours from UTC)
7. latitude
8. longitude
9. ITU prefix allocation(s)
10. other amateur prefixes

Please mail corrections and suggestions to me.

Regarding the compression of present-day satellite digital audio:

The 15-bit-resolution raw encoded data is compressed to 11- or 12-bit RESOLUTION in 1 millisecond blocks. A scale factor is sent for each block. 24 or 25 audio channels fully occupy one satellite transponder, instead of a TV channel.

He obviously never took it. I understand why the FCC wanted to cut costs by not giving the tests themselves and I know that most VE's are honest, but it is obvious from a lot of independent indicators that there are an AWFUL lot of dishonestly obtained ham licenses on the books.

Three or four years ago on the Compu$erve sailing forum I ran across some ocean yacht racers who were conversing about buying their ham licenses from the VE belonging to the yacht club sponsoring a certain race. It was obvious from the their remarks that they genuinely did not know that that was not the normal way ALL hams get their licenses. To them it was like car tags. You buy the radio, pay the fee, and receive your tags.

It's entirely possible they never learned otherwise. They never QSO'ed anyone but other people involved in the races they were in and more than likely never read the regs, ham magazines, or anything else that would have given them the clue.

There are others who DO know it's illegal, but don't consider it any more serious than driving 75 mph on the Interstate. If you say otherwise to them, they laugh at you.

And then there are those in BOTH the sailing and ballooning worlds who genuinely believe (or claim to anyway) that their hobbies are inherently so dangerous that even under normal conditions they are qualified under CommAct section 303 (or whatever the emergency clause is) to use any frequency they want to, with or without a license.

It's a strange world, Charlie Brown.

Antenna questions.

To receive wefax images from NOAA satellites, I had been using a Radioshack Discone antenna, but experienced periodic fade-in / fade-out problems, which I assume is due to rotation of the satellite or a circularly polarized antenna on the satellite. To fix this problem, I built a "Lindenblad" antenna following the directions in the ARRL Satellite Experimenters Handbook. This antenna (which is four folded dipoles arranged in a square, and then each tilted 30 deg out of the squares plane) works OK, but is made of bare 12 guage wire, so that when birds (the kind with wings) sit on it, they bend it all out of shape. My questions are:

1. What would I lose by making it out of heavier stock, such as 1/8 " or 1/4 " refrigeration tubing. I have noticed other posters refer to a rule of 1/1000 for element diameter/wavelength, and the 12 guage wire seems to be the maximum by this criteria. Most TV and other beam type antennas would violate this rule too, but they would probably make up for it via multiple elements.

2. What would I lose by supporting the wire over a plexiglas or wood form. The book specified bare wire.

3. What would I lose by using steel rods and making plain 1/2 wave dipoles instead of the folded dipoles. Some recent posters have been critical of the use of steel for transmitting, but since I'm only receiving, would it be OK?

4 How much am I losing at 137 MHz by using an antenna sized for 145 MHz? I was hoping to use it at both frequencies, and hoped it would be broadbanded enough not to lose much doing so.

5. Could my original fading problem (a very reproducible pattern) be caused by reflection from a nearby TV antenna? If so, how far away from such objects should I be?

6. What other antenna design might be useful? Is there an antenna design which is not ideal for transmitting (and thus left out of antenna books) which may be useful for receiving? I was looking for an omnidirectional antenna, but I could compromise in this respect if the patterns weren't too narrow. I want to avoid having to track, however, if at all possible.

7. Somewhat off the subject, I have both an ICOM 7000 and a RS Pro-34 scanner. With the Pro-34, I can replace the normal antenna with a short length of bare wire, and the radio works fairly well, in fact better than with the supplied antenna. On the other hand, when I first got my 7000, I tried it out with a short length of wire, and it didn't work at all! (ie stations coming in loud & clear on the Pro-34 could not even be heard at all on the 7000). I was convinced that the unit was defective until I hooked it up to the discone. I have seen others comment on "sensitivity problems" with the 7000, and suspect that they were experiencing something similar. Why should a cheap radio outperform a quality receiver with a poor antenna, but the reverse be true with a good (or at least better matched) antenna? I assume that for some reason the 7000 is more sensitive to mismatch, perhaps due to increased selectivity.

I distributed a semi-beta-test Icom R7000 control program (in C++, with source) in the
shortwave group. I neglected to see if anyone here wanted it. It's a 142kB *.uue file.
If you want a copy send me e-mail. There will someday be a post-beta version that
will be announced more widely so if you don't need it in the next month or two,
just hold on and it'll reappear.

I agree with Fred about the unending flame wars over this and a few other subjects. I propose that we start a new group

rec.ham-radio.tech

This way we can leave the endless debates in rec.ham-radio (too bad, actually) and go to a group with some meaning. Having subscribed to this news group for 8 or so years, I have my doubts about getting an agreement to stop the diatribes. Every year we get a new batch of subscribers who don't know these debates have gone on never ending. Maybe, a group whose name is tech (for technical) would allow the rest of us to skip the low information content postings? Probably not, but maybe a smaller amount.

Regards, Dave

A little while ago, my wife favored me with a camcorder for my birthday. It strikes me that now I have the major part of a fast scan TV station. All that's left is the RF front end. Does anybody know if there is any fast-scan activity in the SF Bay Area? What frequencies are in use? Would modified broadcast TV components be adequate? Or is more selectivity/sensitivity needed? Does amateur FSTV use the same partially-suppressed-single-sideband video as broadcast TV? If so, the little TV RF modulators used for video games etc probably wouldn't work, right?

(Minor grammar flame: It's _fait accompli_. Nyah. :-P)
Sadly, I think Bob's right: we will be stuck with a no-code license sometime in the near future. I further agree that these people should be accepted into the amateur community; they will be legally licensed amateur radio operators, after all, and that means "ham" to most of the world.

How we get them into the mainstream will depend on just what the FCC does. It will be more difficult to do so if their privileges are restricted than if they have access to a large portion of the spectrum.

Since we won't have the opportunity to educate the new no-code licensees in amateur operations before they're licensed, since they can get the ticket simply by memorizing a book, we must do so on the air when they get on. This means that we must first clean up our own act.

We must provide the infrastructure they'll need to operate successfully. This will vary widely, depending on what the FCC does, but it may well include building repeaters and packet networks on bands they don't exist on now. We will always be stuck with 1200 BPS AFSK on 2 meters, but this may be our opportunity to build the better network that the PSK types keep promising us on 220 or 440.

I haven't given it much though, since the idea is highly distasteful to me, but since the ham population has caved in to the FCC and gone along (for the most part) with the idea, let's see what we can salvage.

>it is no controversy.

If you are hearing quantization effects, it sounds more like not enough bits/sample than not enough samples/sec. (ingoring things like sigma delta converters where the distinction could get fuzzy).

Do you hear it more on quiet passages than loud ones? That 90-100 decibels of signal/noise ratio on a CD only holds on the loudest passages.

Non linear encoding, or maybe floating point representation would let you cut down the s/n ratio by a few tens of decibels, but have it hold over a wide dynamic range. This could sound better overall, and cut down the bit rate. Sort of a digital form of Dolby.

>Whenever you compress data, you run the risk that some combinations
>of data will take MORE bits after compression. For audio, there are
>a LOT of digital stream values that make no particular sense, such
>as nearly full extremes of values between each sample.

If a full slew between samples makes no sense, isn't that like saying that your sampling rate is higher than it needs to be?

Sunday there was an operation on claiming to be T33X, and I'd sure like to know if anybody has information about whether this one was legitimate. From my QTH it came at the right beam heading, but the fishy thing about this was that just while HK0TU was running a big pile-up at 21.025, the purported T33X came on 21.023 saying "up 1". The results were predictable--he put a pile-up right on top of HK0TU. I'm inclined to think this was just one of the more

creative ways of jamming I've encountered recently. I know that SM7PKK et al
are supposed to show up today as T33R and T33T, but I haven't heard anything
about a T33X operation. Any info would be appreciated.

Not so fast with the sarcasm there! This ad says that their antenna is down
9 dB from a beam. Phrased that way (instead of "only 1 to 1.5 S units down"),
it doesn't sound like such a hot deal. But it doesn't sound like you've got
grounds for a truth-in-advertising challenge either.

+Service is today. Forget Part 97 as it stands now. Totally ignore the
+current Question Pool and VE program and Examination Elements.
+
+Don't start with what we have today, but project yourself forward to the
+end of the Nineties and describe for me the attributes of the (*-IDEAL-*)
+Ham Of The Future.

Ok...given that the minimum list of requirements would include an interest in communications and a series of skills for participation, I would suppose that this hobby might have room in it for a wide variety of people.

1) People that would like to simply communicate, and perhaps participate in the contest aspects of the hobby. Their forte is OPERATING PRACTICE, finely honed and polished. They collect QSLs and chase the rare ones, using mostly commercial equipment. Contests could be devised to give the person without an exotic station a competitive chance. Then there could be contests that cater to the "big guns"...special modes, etc. Always keeping in mind that there must be a means of factoring in the international band rules. For example: The contest is PHONE, the bands are 10-15 & 20, but HAMS with a casual interest might participate, even though they be AMERICAN NOVICES, since they can only work CW in the 21.1-21.2 and CW or digital on 28.1-28.3. ..given a multiplier, there would be some real interest in working these people via cross-mode! These kinds of things build interest and garner a wider participation.

2) People that like to build and enhance the design of existing equipment. Their bread n butter is the technical savy that has always been a part of Amateur Radio. These skills will be sharply challenged by the newer and still emerging materials and component sciences. Lots of cross-level intersts in space and digital applications. This segment of the Amateur community might even begin a series of trainning programs that build the skill levels and recognize demonstratible talent in design much like the CW fans today have their 25-30-35-40 WPM proficiency certificates. Trainning after licensing, to become even better at the game of electronics and communications! Look for advanced science & circuit kits to be a part of all this, perhaps a DIY custom chip kit or an advanced CAD using A.I. and RDBMS to provide the ham with a unique opportunity to design circuits, in real-time and watch what happens in that circuit by simulation...computers are bound to be a big part of what this crowd does, there might even be some new turf discovered by hams as the number of people interested in computer-level communications increases. Spread-spectrum technology applied to reduce QRM and band congestion!

There might be a chance that the Amateur community will combine digital networking, DSP and cellular technologies to provide a "virtual shack" accessable by any Amateur with a minimum of local equipment; perhaps a series of clubs or the ARRL will come up with a "virtual shack protocol" and related hardware specifications to match. Thus a ham with just a 220MHz ht could access a local intertie cell and then a DSP-based network such that 40 meter operations, in any geographic area served could commence! Given greater local resources, a complete ATV station for example, QSOs with other stations in other areas served by the system could provide long distance QSOs for modes that are normally local! Store and forward technology might be employed in this scheme to permit greater flexibility. Eventually, Amateurs might carry an advanced form of the HT, sort of a pocket computer and communicator rolled into one. It would have up and down link capability for network access, DSP for voice, picture and digital modes, touch-tone to access the telephone system and a keyboard similar to that of a court-reporter...all in a small package that could be clipped on a belt or carried in a pocket!

For the operator that is far away from such networks, advanced radios will be different in that the "shack" will probably only contain the control console, and this may be virtual! A plug for the mic, the TV camera, perhaps a hi-speed data line and the console speaker(s). At the other end of a series of light fiber connections will be the actual "rig". It will contain a small microprocessor-based comm system, an advanced DSP/TNC box, a set of common AF/IF/RF stages and then a series of band modules with related bi-linear amplifiers. The remoted combined "rig" will be located near the antennas, perhaps some parts will be firther remoted to AN antenna or combination of antennas in an array.

The operator might elect to have a local link to his shack, using one of the advanced pocket communicators, so that he is free to roam the property much as we do today with voice using our computers and a local remote frequency; ala 'Shackmaster' and 220MHz. Thus, where the big networks do not exist, the Amateur will erect a local net, in time these might be the expansion-base for interconnecting to a nearby node of a larger net. This sharing of resources is pointed to by the large, open repeater network and the growing network of packet nodes on 2 meters and other bands.

+
+What does this person know? What skills and attitudes would such an
+individual have? Pretend you can, in your dreams, make Amateur Radio
+in the Twenty First Century what you would like it to be.
+

This person will know a great deal more (on average) than the majority of Amateurs today. It will be necessary because of the increasing technology and the increased use of networking. Some pockets of resistance will build small cliques of 'old-timers', content to operate and maintain antique gear and much as today we will all point at the fierce independence of thought that typifies the Ham community! Eventually even the best of gear becomes obsolete, or is darn-near impossible to fix, find-parts-for, or Mickey Mouse into working. Some gear winds up trashed because the spectral output is no longer considered "GOOD"...this is how the older equipment will most likely wind up. It's possible though, that with the skills that some people have, that we may be hearing operators using equipment from the 1940's and up that has been re-engineered to newer specs. These will be some interesting projects for the hams that enjoy the tech side of it all.

+How should the public and the government view the Amateur Radio Service?
+What value does it provide, or in essence, WHY does Amateur Radio exist
+in the year 2001?
+

The public service side of the equation will continue to showcase the responsive nature of Amateur radio. In times of disaster, public means of communication drop dead. The telephones and radios used by Joe Public although very reliable cannot handle the traffic that emergency situations generate. Earthquakes, floods and the like continue to prove this again and again. On the world scene, Amateur communications are sometimes the only means by which news of events can be relayed, especially in cases involving massive civil insurestions and war.

The government will undoubtedly gauge the usefulness of Amateur radio by the leaps in communication art that we provide, plus our educational values. In that there is an increasing need to interest young people in technical careers, and to provide healthy alternatives to 'hanging-out', Amateur radio can provide opportunities to our youth that cannot be found elsewhere...if the existing ranks are willing to grow and change!

Here's the catch: If the ranks don't grow, and the frequencies lie dormant we may very well see the governments reducing or eliminating our allocations!
I favor a restructuring of the licenses. The elimination of CW skills above 5 WPM for General-Advanced & Extra. If people honestly desire to communicate at higher speeds in that mode, special subbands can be established exactly for such purposes. Endorsements are another option. The no-code license is clearly the license of the future, because most people don't care about CW, any more than they care about using a Spark-Gap transmitter!

Far off in the future is the lure of space travel, of industrialization off-planet and the like. Communications plays a valuable part in all these endevours. Persons with skills in communications, in the technical phases of communication science will find their talents highly sought after. Much as the government welcomed Amateurs in times of war, to be the experts in communications, so in times of peace and expansion of humanity into space the governments will again turn to the Amateur ranks to find those persons active and interested in the art of communications. We are a valuable part of any future that we can visualize.

One way to make a twinead J-pole with greater mechanical strength is to slip the sucker inside a 6 ft piece of of PVC pipe and seal the ends.

This has nothing to do with Ham Radio, but since it was posted on the net ...

In English, the pronouns used to denote either male or female are "his" and "him". Yes, this is the same pronoun used to denote male. This is not sexist; it is simply the way the language's grammar works. To use the language correctly, you must use "his" and "him" for singular pronouns, not "he/she", "him/her", or "na".

Unfortunately, because of this lack of a neuter pronoun, most people make grammatical errors such as:

> Everyone should get their ham radio license.

"Their" is plural and "everyone" is singular, so this is an error. Some well-intentioned feminist-types do this:

> Everyone should get his/her ham radio license.

This is distracting for written English, and even worse for spoken English. (What should one say? "HIM SLASH HER", "HIS OR HER", or what?) Try reading a document that contains a lot of "his/her"s, and you will see what I mean. The author of the previous article talked about this:

> Everyone should get na ham radio license.

Huh? That would sure take getting used to, all right. No, sorry, the only acceptable form is:

> Everyone should get his ham radio license.

Like I say, no sexism is intended. I really believe that feminists could further their cause a lot better by spending time and energy on issues that really affect women, like day care, pre-natal care, equal pay for equal work, etc. Changing the English language would do nothing to help anyone.

There seems to be some variance among VEs on using essay vs multi-guess.
All of my code tests have been essay, and the answer had to be exactly
what was sent.

>>CW is probably more common to all amateurs than any other particular
>>mode.  One could argue that this is *because* of the international
>>CW requirement.  Yup, that's right.  Think of CW as having the same
>>function in amateur radio as American English has in the US.  It's the
>>"watering hole" where the packeteers can meet the FSTVers.
>
>CW is a MODULATION method not a LANGUAGE!

You see the trees, but miss the forest.  My point is that CW is the one
modulation method that everyone knows.  That, in itself, is a useful
function.

| selfish and arrogant. You want to change ham radio in ways that I think will
| destroy it.
+---------------
```

My desire to change ham radio in ways you think MIGHT be harmful is "selfish and arrogant", but your desire to keep it a closed clique of spark-gap worshippers is open and forward-looking?

PuhLEEEZE. I'm over here, a mere Technician, but working on integrating TCP/IP into the local packet network to improve packet for everyone including straight AX.25 users, and on getting young blood into the hobby, and you call me selfish and arrogant for wanting to remove an antiquated communication mode from the entry requirements. Of course, my efforts don't count because I don't do it all in CW at 35wpm, so I'm not a "real" ham, just a glorified CB'er. (heavy sarcasm off)

So what have *you* done to help us keep what remains of 220MHz lately, anyway?

```
+---------------
|             You may have the best of intentions, but I don't think you know
| and understand what has kept the hobby alive for the past fifty years. The
| deterioration of good operating procedures we all now hear on the bands is a
| direct result of the loss of the sense of fraternity and tradition that I still
| hear on CW.
+---------------
```

Funny, but the only place I hear lots of "in-your-face", as you put it later in your manifesto, is on HF. Including carrier-sweeping when I got my good HF rig back early and tuned in the Sweepstakes. Note that I'm talking about the *CW* contest! So much for "good behavior". The local folks on 2m, 220MHz (remember that? Once upon a time, it was a ham band), and 440MHz, both FM and packet, are by and large good folks who are willing to lend a hand to others and still know good behavior. It almost makes me thing that we should just leave HF to the CB'ers and suchlike and concentrate on the bands where one still finds common courtesy.

Luckily for you, I don't advocate such a course. And I *do* use CW. But I see no reason to force it down people's throats, just as I don't force packet down everyone's throats.

I currently have an Icom IC-735 HF rig which was the smallest and lightest full feature HF rig available when I bought it about four years ago.

Is there anything that is still smaller and lighter than the IC 735? The rig is still a little heavier and bulker than I would ideally like for bicycle mobile use.

Thanks for your help!

Somehow, I have trouble swallowing the argument that 5 WPM code keeps the brightest minds out of Radio. A truly disciplined mind will recognize the CW requirement for what it is ("an interesting, but irrelevant baseband modulation example"), spend the 6 hours or whatever learning it, and then get on with being brilliant.

If the HF Olde Phartes want to be masochistic, let them. You don't need 13 or 20 CW for getting the bands needed for some cutting-edge work.

My personal opinion is that Hams haven't worked hard enough at promoting what the Amateur Service provides to the brilliant minds - a personal playground at real power levels and bandwidths. We have not shown how computers can "marry" radio, with interesting results.

Besides, computer hackers can make more money in their spare time by hacking computers than by using _Amateur_ (read "non-profit") Radio.

You can make -9 from +13.8 by using an inverter. If the current requirements are not too much, it can be done with a PWM chip and a couple capacitors. Look in some of the power chip catalogs from TI/National/...

You see the forest, but miss the gopher holes. :-)

I passed my test last June and I assure you that right now I, an active ham operator, do not know the CW modulation method. Or more precisely, I don't know Morse code well enough to make any practical use of it. So my taking the code test was only valuable (to me or anyone else) in one way: it enabled me to be licensed.

That sounds cynical, so let me be clear, I'm not *proud* of not knowing it any more, or anything like that. I just don't find it necessary or useful to know it. So naturally it has slipped away.

Hi,

I am interested in buying a ham to talk mainly to people in the persian gulf. Has anyone out there talked to people there, and if so, is the communication clear?. . What kind of equipment do I need. I am a beginner and don't know much about this. Any info is appreciated.

Thanks in advance.

While we're on the topic of origins of abbreviations such as VVV, does anyone know what the abbreviation "QAM" might stand for. It's sent in CW at the end of the television weather broadcast in Germany. Maybe it's just something the producers thought sounded pretty.

Hallo!
Is there anyone who knows the Japan Radio Company? Are their HF rtx worth buying? A friend of mine is interested in model jst-135... I'm wondering why there was an almost-new one in the used-gear-window, just a few weeks after I got the brochure (...is it brochure the correct term for those papers full of photo's and good performances? ;-)).

ciao de IK5*** (why shall we wait

> specs.
> Grover Zinn
> ex-W5vyu

I went to my collection of old CQ magazines, and found some of the original articles by G.L. Countryman, W3HH.

Basically it is a sloping folded dipole with a terminating resistor opposite the center feedpoint. You can think of it as a squashed rhombic turned on end. It is non-directional and operates over a 5;1 frequency range.

The original article is in QST, June 1949. There were several follow-up articles in CQ, and I found some in November 1951 CQ and February 1953 CQ.

The length from end-to-end in feet is 328/MHz for the lowest frequency. Of course, the total wire length is twice this.

The spacing between the wires is 9.84/MHz for the lowest frequency.

The sloping angle should be about 30 degrees.

The terminating resistor should be non-inductive, and have a rating equal to 35% of the transmitter power. It should be slightly higher in value than the impedance of the line in ohms. The author recommends 650 ohms for 600 ohm feeders, 500 ohms for 450 ohm line, and 390 ohms for 300 ohm line. Instead of a resistor, you can use a shorted parallel line of resistance wire (!) running away from the antenna.

It is fed with 600 ohm balanced line.

It is called the T2FD, or "Tilted Terminated Folded Dipole".

I think Bill Orr may have written about it a few years ago in his column in Ham Radio Magazine.

Has anyone used this antenna? They sure raved about it in the 1950s. I wonder if that B&W broadband antenna that is fed against ground at one end, and is terminated against ground at the other, may be electrically similar?

Also, I wonder if a Zepp (non-resonant dipole) with balanced feeders and a tuner might have just as much bandwidth, but without the loss of the terminating resistor?

When this article was written, 600 ohm balanced outputs were common in ham gear, and they didn't operate over wide impedance ranges like the antenna tuners that we use today, so this might explain why this antenna was so popular.

With a mixture of local and wide area, the range is often just as
varied. Wide area repeaters also often, but not always, extend their
range with extra receive sites, or linking with other repeaters.

From my parents home, I can hit a Columbus Ohio machine via its
Portsmouth receiver 45 miles away.

Repeaters such as the 145.250 machine in Indianapolis have quite
a range of over 100 miles. There are extra receivers but only one
transmitter on the one frequency. It also has a couple of links to
other repeaters on other frequencies. Owned by WA8VZY.

i have been following the net closely for mods for my ic2sat
and have had rather little success. I have seen a lot of
mods for the ic24sat, but they don't do me much good. If
anyone knows any mods, (either internal or some sort of
external reset) i'd appreciate it if they could be e-mailed
to me. Perhaps they should be posted to the net as well.
My ic-2sat is a fairly early serial number (at least
pre 010000).

thanks for your help

Re: Sweepstakes. There seemed to be lots and lots of cw in the RTTY and AMTOR segments. I realize that 14.070 to 14.090 (and similar segments in the 15m and 10m bands) are for the digital modes only by "gentlemen's agreement" (sorry about gender insensitivity). I know that by the letter of FCC LAW cw can be sent anywhere on the band. But I think that it would be nice for all concerned if people would observe the various "mode segments" of the bands. Otherwise, why should I stay confined to such a small 10kHz (AMTOR) segment? Why can't I send AMTOR and/or Baudot RTTY down at 14.025-14.070? I would like to do that a lot.

Any comments from the cw fans?

It seems to me what's good for the goose...........

Cheers,
Don

Please send the actual keplerians, since I believe they are of greater value to the amateur radio society than the 2-line format description.
Why has the posting of keplerians lately ceased? A couple of months ago we still received regular postings...

Keep up the good work, continue posting !

Argh!   Come ON! 5 words per minute is so ridiculously easy to learn...

America is suffering a decline because too many people are getting fat and lazy. It is really no big deal to learn 5 WPM CW. Instead of learning it over the course of a few evenings, however, too many people spend all kinds of energy trying to lower the standards.

I say "More is not necessarilly better." Lowering standards that are already low is no solution, unless you LIKE Citizens Band.

I just got a very nice Hallicrafters
SX-16. It's complete and probably
working. It is fairly dirty inside.
The lettering on the outside is kinda
brown looking.

I have a couple of questions for
you collectors out there.

1. I'm assuming that the lettering
   should be white. Am I correct?

2. What should the finish look like
   on the inside chassis and the transformers, etc.?

3. Whats a quick way to clean the metal
   surfaces inside the cabinet?

Thanks,

Jim Allen

I don't know about T33X, but last night (Monday, 5 OCT) at 0018Z
T33WV was on 10 meters at 28.495 running simplex. He said his QSL
route was his home call of DK2WV.

Also on 10 meters was C21NI on 28.485 at 0000Z first running split up 5 then later on running simplex. This is Kiyoko and she is doing the same fine effort here as on ZK1, ZK2, ZK3, and any others I may have missed.

```

I can copy well in the 20-22 wpm range for QSO's and was able to handle the contest exchange in the 25 wpm range. Some of the operators slowed down to my calling speed with out my asking, others put up with my requests for repeats and a couple real fast ones responded to my QRS with out a comment and gave me the QSO. I did notice that when some of the real fast fellas slowed down they got a series of calls, but soon as they increased there speed the calls slowed down. If a given operator is too fast, try QRS, many will respond at a slower speed that matches your sending speed. Key point - send at a speed you can receive! Don't feel bad, this was my first real serious attempt in a CW contest and I just bearly made my PIN.

I don't think a machine is a practical way to copy code during the contest. I did however feel that a number of operators were using CT or NA for logging and replies. The 4-5 sec delay after I called before they came back seemed like my call was being checked in the computer. I really don't see a problem with using the computer or a memory keyer for the replies, except it tends to increase the operating speeds. Certainly for the logging chores, a computer is the ONLY way to go.

I wish to ask a fundamental question. Why are there so many questions on this newsgroup (and the Fidonet HAM and PACKET echoes) on "How do I plug in the power cord?" or "Why isn't the documentation more specific on whether the machine screws tighten clockwise or counter clockwise?"

When I was a baby ham, almost the only documentation was the circuit diagram. We studied that. Maybe poked around "The Handbook", and then tried it. If it smoked, plunged the whole block into darkness, or made the cat's tail stand up straight, we knew we were headed in the wrong direction. If some Old Fart said, "There's a lid tuning up on the frequency", we knew it was "getting out".

Come on, guys, take a chance. Live a little.

>

Alan, the unfortunate thing is that it is required by international agreement for work on the HF bands. However, what is NOT required by that agreement is speed above 5 wpm. Since we HAVE to have code for HF, we should test ONLY at 5 wpm. If people think it would be nice to show greater proficiency than 5 wpm, let's roll that into the written exam process by adding questions to the written. I.e., let's add 5 code questions to the extra, increasing the questions asked to 55 and the passing score to 41. That way, if you fail the five code questions, you don't fail the test.

I have a housing site in the hills which affords the use of hill
behind the site which is about 4-500 feet higher, which is also part
of my land. I would like to place my antenna at the top of this hill.
The horizontal distance is about 200 feet. The problem of course,
is connecting the radio to the antenna. Cable sounds too expensive.
Has anyone on the net had any experience or thoughts to relate on
this problem (radio links, remote transmitters, etc ?). Thanks in

advance.

- John

Back in the old days, when us olde phartes had to take our tests at the
FCC field office, my elmer gave me some advice on how to make the
code test a little easier. I was going for my Advanced (13WPM) and
he said, "Be sure to copy EVERYTHING, including the VVV VVV at the
beginning of the test, because it counts toward the 1 perfect minute."
I thought he was BSing me, but he was adamant. So, at the test, the
FCC examiner starts the code machine, and sure enough, "VVV VVV VVV"
was there! Nine characters out of 65 (13WPM x 5 char/word)! Already
got 14% of the first perfect minute!!! YAHOOO!!!!!!!!!

Let me add my voice to what I hope is a choir of congratulations on your successful challenge. I'll be following this one closely to see if perhaps there is a court precedent you have won that I can use.

A little over a year ago I went through 3 planning commission hearings and a city council appeal on my application for a 65' tower. The circumstances were identical to yours. The city has a ordinance which is not in gross violation of PRB-1 (max height of 65' permitted with setbacks, etc.). Everything in my application was precisely consistent with the zoning ordinance, and I even have a letter from the city planning director to that effect. HOWEVER, the planning department required a public hearing before they would grant a permit. Two neighbors complained. The finding was that:
- the zoning ordinance states that "conditions may be imposed upon the issuance of a building or use permit to mitigate the visual impact...";
- the planning commission, which was later upheld by the city council, interpreted this as "it is required that steps be taken to mitigate the visual impact";
- per the judgement of the planning commission and the city council, I had not taken adequate steps to mitigate the visual impact;

 - therefore I was not in compliance, and the request was denied.

I could never get anybody to volunteer anything about what would be an adequate step to mitigate the visual impact. I offerred to put the antenna anywhere on my 1 acre lot they wanted, and even offerred to reduce the height requested. In the end, it was "make a specific proposal and we'll tell you if it passes". I made 3, and none did. Exactly the same as in the situation you just fought, it boiled down to the question of take years and many $K to fight it or just throw in the towell. I chose to fold and come back another day; you chose to put your money on the line. Your willingness to take a stand and risk your money will probably help me in my next attempt as well as every other ham who runs into local governments that want to ignore PRB-1 because they are banking on our unwillingness to fight it in court. If you'll post an address for people to send a contribution for your fight, I'd sure like to be the first to get my check there. Thanks for going to bat for all of us.

AA6KX

P.S. Did you ever try serious DXing/contesting with a 14' boom up 30'? It stinks.

(Really, a linear amplifier in the output will give you a lot less
grief than a non-linear amplifier. Unless you want to use it for FM
or CW only....then Class C is just fine.)

Ummmm....I hope this isn't rude, but is this guy a licensed ham? Something
about having a technician modify the radio so he could "talk some skip"
has me wondering.....

I worked this guy on 10M CW about an hour before he showed up on 15M
es started QRMing the HK0TU operation. Given the fact that the signal
strength of the HK0 was not so hot in CA, presumably a few thousand miles
closer than Banaba Is., I'd be willing to believe he couldnt hear the HK0.

Though....he should have been able to get a sun-tan from all of the RF from the pileup 5KC up ! So, maybe he had no excuse. Some DX'ers on the KN6J DX packet node thought they knew his home call. DJ6??? if I recall.

73 es all that ham stuff

From Allied Communication Publication (ACP) 131(C), "Communication Instructions - Operating Signals" --

	Question	Answer,advice or order
QAM -	What is the latest meteorological observation for _____ (place).	Meteorological observation made at _____ (place) at ____ hours was as follows....

> CW at the end of the television weather broadcast in Germany. Maybe
> it's just something the producers thought sounded pretty.

Should be at the front.

ACP 131(C) is the handbook for Allied forces concerning the usage of Q and Z signals. Some of the more interesting ones -- QBF (Are you flying in cloud?), QRU (Have you anything for me?), QRZ (Who is calling me?), and ZBF (For the following message use large message forms).

<  In any case, small antennas have low impedance and consequently high
<  resistive losses, which are going to make things look worse than theoretical
>  efficiencies.
```

For small loop antennas, radiation resistance is proportional to the square of the loop area. This is proportional to the FOURTH POWER of the loop diameter.

For short dipoles, the radiation resistance is proportional to the SQUARE of the length. Short dipoles have higher radiation resistance than small loops of similar size (less than about .1 wavelength max dimension).

On the other hand, it's much easier to get a low-loss match to a loop since no loading coil is needed.

In rec.ham-radio, vester@canisius.UUCP (Karl Vesterling) writes:

I have a Uniden HR2510, and I had a technician replace the driver, and
final transistors. It now does 10 Watts on AM dead key, and 40 Watts on Side
Band (all are RMS readings). I still would like more power. Up here in
Buffalo, 10 Watts AM, nor 40 Watts on sideband is still not enough to talk some
skip.

I have heard of people getting 90 Watts out of this radio RMS sideband,
but I have no idea on how to do it. Dual finals? Maybe, but I thought I'd ask
you if you knew anything about this, or had some hints. Please don't send me
mail saying, "Get a Ranger". I don't want to use a linear amplifier because
I have had them, and they come over the neighbors cooking utensils, and vast
other appliances.

Any help would be appreciated, even a phone number!

You could try a device I once saw advertised in a CB magazine. It basically
was a voltage step-up transformer you connect between the radio and the
power line.   :-)

I can copy 40 wpm comfortably in my head, maybe 50+ wpm with difficulty,
but there are still a few contest stations that are too fast for me
(KH6IJ is one that comes to mind).  I have to resort to listening to him
do 2 or 3 exchanges so I can get the exchange correct before I work him.

A minor bone to pick. Most of the hams I know, including myself, learned
CW using tapes and morse trainer programs, not off the air. My initial
education in ham radio came from buying a 2m ht while I was still waiting
for my ticket to arrive, and LISTENING. In any event, we're in agreement that
we'd better clean up the various messes up on the bands (2m, 20m come to mind).

stu@tandem.com (Stuart G. Phillips) writes:

> Having participated in the CW version of Sweepstakes this last weekend I'm beginning to wonder whether the use of "artifical aids" such as PK-232, MFJ 1278, morse machines etc, should be specifically prohibited by the contest rules.

I don't know if there oughta be a law, however, it would take the fun out of it (for me) to use any kind of copying aid -- other than better filters etc or another ham listening with you when multi-op. I worked in the slow speed areas, and got the impression (from sending mistakes and the like) that most others were operating 'manually'.

> In working my (puny) 99 contacts (one short of the pin :-(( ) I was forced to resort to using my PK-232 to copy the machine gun style CW sent by so many stations. As a non-Extra class Ham of the Advanced class (or so they tell me I can comfortably copy 17-18 wpm and am slowly working my way up for the Extra. The PK-232 was claiming that much of the CW was sent around 30 wpm or more ! I understand that there are people who can do this speed and better but I've always thought there werent many.

I worked 93, so I know just how you feel! I was cruising along with 100 in sight Sunday afternoon, but the broadcast stations filled up the slow-speed part of the band (my station good only on 40, although I got a few on 15). I can copy 15 wpm (on a good day :) and had no problems at all with others' speed in the slow-speed segments. Seemed like most were less than 13 or would adjust to your calling/answering speed. I would occasionally dip down into the high speed band and find a nice signal that I could 'almost' copy, listen for a few rounds to get the exchange and then call (at my puny straight key speed). Typically, they would come back closer to my speed, and usually throw in an extra TU or 73 (an 'A' for effort?). Anybody care to comment on whether the CW cheetahs regard the turtles as another welcome contact or a nuisance (assuming we've listened enough to have a good chance at completing the exchange in one try)?

Only in one case could I not copy someone at all -- I answered their weak (slow) call and could just not get any of the exchange. When I asked for a "pse rpt all?" they came back with something different so maybe they couldn't copy me either. I subsequently discovered I had been operating for about an hour with RF gain backed off (short circuit in the brain hi!). I had about three qso's with people that didn't know a contest was going on (or didn't hear my SS).

> CW contests seem to be losing their charm and degenerating into a poor mans RTTY contest.

My first, so I really can't say. I hope not, because anyone that has a
CW copying aid can likely just go ahead and do RTTY (which I also hope
to do sometime).

> I wonder how many stations were using PK-232 etc for sending and/or
> receiving
>
> The ARRL had attempted to establish slow-speed segments for mere mortals
> such as me but there was a positive lack of activity in these segments in
> my part of the world.

Maybe you're in wrong state (:->). I stayed up late Sat. to catch
some 6's, but didn't hear many. However, this was when I had my RF
gain messed up! If it wasn't for that, I might have broke 100.

Seriously, maybe our expectations are just different. Seems to me that
you did pretty good for "first semi-serious attempt".

I thank the ARRL for thinking of us slow-speed coders. People tell me
that this is a new thing. If so, I hope there is enough response that
they do it again. I don't know if I'll ever be able to copy the big
guns!

> Thoughts, comments ????????
>
> Stu N6TTO
>
> PS: This was my first semi-serious attempt at a CW contest; it will probably
> be my last until I can copy 35 wpm !

My first too! I hope to be at the next.

Thanks for starting up this subject, and I hope more will come forth
with their SS experiences and opinions.

> Lots of stuff deleted...

I built one of these about four years ago using the 390-ohm terminating resistor and a 6:1 balun obtained from Palomar Engineers so I could feed it with 50-ohm coax. The performance was less than spectacular. The model I made was cut for 40 meters, so I expected it to work anywhere from 40 through 15 meters. The SWR was about 2.5 or 2.7 to 1 across all of 40 meters. It was worse on 20. It was actually quite broad on 15 meters, about 1.3 to 1 across the entire band.

I tried to "A-B" this versus the 40-meter dipole I had up at the same height as the T2FD. The T2FD was consistently two S-units below the 40-meter dipole. Since it had a very nice SWR on 15 meters, I thought I'd compare it against the TA-33 that I had up at 40 feet. The T2FD was consistently 5-6 S-units below the tribander.

I threw the T2FD out.

```

>
>1.   What would I lose by making it out of heavier stock, such as
>     1/8 " or 1/4 " refrigeration tubing.  I have noticed other
```

> posters refer to a rule of 1/1000 for element diameter/wavelength, and the 12 guage wire seems to be the maximum by this criteria. Most TV and other beam type antennas would violate this rule too, but they would probably make up for it via multiple elements.

Breaking the 1/1000 rule will cause the optimum element lengths to vary from the values calculated by the simplified equations in the handbooks. Fatter elements will also be more broadbanded. Don't get too carried away or the antenna will be squirrelly to tune. 1/100 should be safe.

>2.   What would I lose by supporting the wire over a plexiglas or wood form. The book specified bare wire.

One of our locals made the whole thing out of TV twinlead stuffed into pieces of PVC pipe. Seems to work fine for receive. PVC is lossey at these frequencies so I wouldn't want to transmit through it.

>3.   What would I lose by using steel rods and making plain 1/2 wave dipoles instead of the folded dipoles. Some recent posters have been critical of the use of steel for transmitting, but since I'm only receiving, would it be OK?

Steel has high resistance at RF frequencies. It would work, but would not be ideal.

>4   How much am I losing at 137 MHz by using an antenna sized for 145 MHz? I was hoping to use it at both frequencies, and hoped it would be broadbanded enough not to lose much doing so.

This makes a significant difference. First, an antenna cuts off much more rapidly on the low side of center than the high side. Second, the phasing harness for the Lindenbad will be completely wrong so you don't get the desired circular polarization.

>5.   Could my original fading problem (a very reproducible pattern) be caused by reflection from a nearby TV antenna? If so, how far away from such objects should I be?

Probably not. What you describe sounds like classic polarization fading. As a rule of thumb, an antenna should be at least 10 wavelengths away from another to avoid near field effects. Some people say 100 wavelengths, but I've found 10 a good compromise.

>6.   What other antenna design might be useful? Is there an antenna design which is not ideal for transmitting (and thus left out of antenna books) which may be useful for receiving? I was looking for an omnidirectional antenna, but I could compromise in this respect if the patterns weren't too narrow. I want to avoid having to track, however, if at all possible.

The Lindenbad is probably the best nondirectional circular polarized antenna you can build. Concentrate on making it work right and you'll be happy.

> (or at least better matched) antenna? I assume that for some
> reason the 7000 is more sensitive to mismatch, perhaps due to
> increased selectivity.

The R7000 is designed to match 50 ohms. It will not be happy with a short high impedance end fed wire. The Pro-34 is a typical high impedance design and works best with an end fed high impedance wire. When you attach the 34 to a good communications antenna matched to 50 ohms through 50 ohm coax, you grossly mismatch the radio and, except for the possible advantage of having an antenna high and in the clear, don't see an improvement. The R7000 however comes into it's own when properly matched.

Glad you saw it, Ken. I had you in mind when I posted it.

First, it orginates (Sure!) originates as a groupmail conference in a fidonet technology net. Groupmail is somewhat analogous to a moderated newsgroup. I was planning on gatewaying it into a mail list until and unless there are enough takers to warrant setting up a newsgroup.

Of course, if you have a Fidonet compatible mailer (FrontDoor, Binkleyterm, SEAdog, D'Bridge, etc., and GROUP.EXE, you can pick it up directly from the moderator.

I should comment that, for those who have not sent me their tapes,
it seems to me to be wiser to send them to the post office rather
than my home. I say this because I have received 2 tapes at the
house (maybe 3, I lose count), and both have been left in space
between the screen door and the back door at my townhouse complex.

The tapes are only marginally hidden there.

Fortunately, the dogs in the neighborhood do not wander around too much, so damage from that sector will be minimal... :-)

Ah, well....

Just to remind everyone about the un-net this weekend:

Remember that, "every weekend" "we" hold an un-net.

What's an un-net? And why did I quote "every weekend" and "we" above?
I'm glad you asked!   :-)

The Un-Net is a time, 2 frequencies, and a lot of fun. It is not a net, given the characteristics of 10m prop. What you do to join it is to get on one of the 2 frequencies (or as close as you can get) and call something like "cq usenet". See if you can find any other usenetters to talk to. (I've managed at least 6 or 7 so far) Keep it up for as long as you want, but the "major time" range is, as you can see from my .sig file below, 1700 UTC till 1900 UTC.

Ok, now, why did I quote "every weekend"? Because not everybody gets on every weekend.

And why did I quote "we"? Because I doubt that many people get on very regularly. I will finally be active during the un-net this Saturday (the 10th), having been inactive for about the last 3 or 4 months...

SO, I look forward to "seeing" you this Saturday!

PROPAGATION FORECAST BULLETIN 42 ARLP042
FROM ED TILTON, W1HDQ
WETHERSFIELD CT OCTOBER 15, 1990
TO ALL RADIO AMATEURS

DURING THE FIRST HALF OF OCTOBER THE SOLAR FLUX ROSE AT A FAIRLY RAPID RATE. AS OF SUNDAY NIGHT THE FLUX HAD REACHED 220, TEN POINTS ABOVE THE SEPTEMBER PEAK. COMBINED WITH THE EXPECTED IMPROVEMENT IN PROPAGATION AT THIS TIME OF YEAR, THE SECOND HALF OF THE MONTH SHOULD BRING IMPROVED DX CONDITIONS, ESPECIALLY ON 28 AND 50 MHZ.

AS TO THE LATTER BAND, WE ALREADY HAVE REPORTS OF TRANSATLANTIC DX ON 50 MHZ IN RECENT DAYS. THE REST OF THIS YEAR AND THE EARLY MONTHS OF 1991 SHOULD BE GOOD TIMES FOR USERS OF 21 MHZ AND HIGHER FREQUENCIES UP THROUGH 50 MHZ. THE PEAK IS LIKELY TO COME IN LATE NOVEMBER. THE CONDITIONS MOST IMPORTANT TO 50 MHZ ARE THE INCREASED OCCUPANCY AND THE VASTLY IMPROVED PERFORMANCE OF SOLID STATE GEAR FOR THIS BAND.

SINCE LATE SEPTEMBER AND THROUGH MOST OF OCTOBER, THE AUTHOR OF THESE BULLETINS HAS BEEN VISITING FRIENDS AND RELATIVES IN CONNECTICUT AND MASSACHUSETTS. WE EXPECT TO BE BACK IN SPRING HILL, FLORIDA, BEFORE THE END OF OCTOBER. WE OPERATE MAINLY ON 21 THROUGH 144 MHZ, BUT ARE SET UP FOR ALL BANDS FROM 3.8 TO 432 MHZ. OUR MAILING ADDRESS IS PO BOX 5529, SPRING HILL, FL 34606.

AMERICAN SUNSPOT NUMBERS FOR OCTOBER 4 THROUGH 10 WERE 152, 123, 113, 149, 169, 134 AND 152 RESPECTIVELY, WITH A MEAN FIGURE OF 141.7. SOLAR FLUX NUMBERS AS REPORTED BY WWV FOR THE SAME TIME PERIOD WERE 184, 169, 169, 168, 179, 182 AND 192, WITH A MEAN FIGURE OF 177.6. AR

DX BULLETIN 42 ARLD042
FROM ARRL HEADQUARTERS
NEWINGTON CT OCTOBER 19, 1990
TO ALL RADIO AMATEURS

THANKS TO ALLEN, N2KW, AND THE TRISTATE DX PACKETCLUSTER NETWORK FOR THE FOLLOWING DX INFORMATION.

BANABA, T33. A MAJOR EXPEDITION IS DUE NOVEMBER 7 TO 21 BY AN ALL STAR TEAM INCLUDING JG2BRI, OH1RY, OH2BH, SM7PKK, AND TF3CW. SIGNING T33T ON CW AND T33R ON SSB WITH FIVE COMPLETE STATIONS, THEY WILL BE ACTIVE ON 160 THROUGH 10 METERS. QSL CHORES WILL BE HANDLED BY OH3GZ.

BENIN, TY. LOOK FOR TY1DX OCTOBER 25 TO NOVEMBER 3, POSSIBLY SIGNING TY2A IN THE CQWW SSB CONTEST. THEY WILL OPERATE MOSTLY SSB, WITH SOME CW ON REQUEST. QSL VIA IK6FHG.

TY1PS IS OFTEN ON RTTY AROUND 21088 KHZ AT 2000 UTC.

BRUNEI, V85. BOB, N2OO, RETURNS TO V85 NOVEMBER 12 TO 16, POSSIBLY AS V85OO. HE WILL WORK MOSTLY CW ON 80 THROUGH 10 METERS.

CHRISTMAS ISLAND, VK9X. FRANZ, DJ9ZB WILL JOIN VK2RQ AND VK3DHT FOR A TWO TO THREE WEEK OPERATION FROM CHRISTMAS ISLAND WHICH IS JUST ABOUT TO START.

COMOROS, D68. FRANK, DL7FT, WILL OPERATE FROM THE COMOROS THIS MONTH. HE WILL ALSO ATTEMPT TO GET ON THE AIR FROM 5R8 IF POSSIBLE.

MALAGASY REPUBLIC, 5R8. DL7FT AND THE COLVINS WILL ATTEMPT TO ACTIVATE THIS ELUSIVE SPOT BEFORE THE END OF THE YEAR.

FEDERATED STATES OF MICRONESIA, V63. FOLLOWING THEIR SUCCESSFUL KC6CQ OUTING, OUR INTREPID CANADIAN FRIENDS ARE DUE AT V63 OCTOBER 16 TO 31. QSL MANAGER VE3JDO WILL BE A VERY BUSY FELLOW NEXT MONTH.

MARSHALL ISLANDS, V73. AFTER THE V63 OPERATION, THE CANADIAN TEAM PLANS TO BE QRV FROM V73 NOVEMBER 1 TO 4.

MOZAMBIQUE, C9. LLOYD AND IRIS COLVIN ARE ON THE AIR FROM MOZAMBIQUE. LOOK FOR C9QL ON THE HIGHEST BAND WITH PROPAGATION STATESIDE. QSL YASME.

NAURU, C21. TRANSPORTATION PROBLEMS HAVE CANCELLED THE VK2GJH C21 TRIP. MATS, SM7PKK, SHOULD BE QRV FROM C21NI BY THE END OF NOVEMBER.

QATAR, A7. LOOK FOR AHMED, A71CD, AROUND 28480 KHZ, FROM 1200 TO 1300 UTC.

SAUDI ARABIA, HZ. 7Z1AB WILL BE A 15 METER SINGLE BAND ENTRY IN CQWW SSB. OPERATOR K2ZJ WILL QSL VIA KN2N AT THE ADDRESS LISTED IN 1990 CALLBOOK. 7Z1AB IS REGULARLY ON 21275 KHZ AT 2100 UTC, ACCORDING TO VP2ML. PLEASE REMEMBER THAT 7Z1AB QSL CHORES ARE NORMALLY HANDLED BY WB2WOW. HZ1AB, LOCATED WITHIN A MILITARY DEPOT, IS TEMPORARILY QRT.

SOUTH COOK ISLANDS, ZK1. SIGGI, TF3CW, WILL SIGN ZK1VS IN THE CQWW CW CONTEST. THIS IS HIS WAY TO UNWIND FOLLOWING THE BANABA EXPEDITION NOVEMBER 7 TO 21.

SOUTH GEORGIA, VP8. GORDON, VP8CDJ, HAS BEEN ACTIVE ON 14256 KHZ, MONDAYS AT 2230 UTC. LAST WEEK, THE LIST WAS TAKEN BY VP8BXK, SOUTH ORKNEYS. QSL VP8CDJ VIA GM4KLO. QSL VP8BXK VIA W9ARV.

ST. PAUL ISLAND, CY0. FP5DX AND VE1KM WILL BE ACTIVE ON 160 THROUGH 10 METERS BOTH CW AND SSB, FROM OCTOBER 20 TO 30 SIGNING EITHER CY9SPI, OR CY9DX. RTTY OPERATIONS ON 20 AND 15 METERS ONLY. QSL TO FP5DX.

TUVALU, T2. MATS, SM7PKK, WILL BE QRV FROM TUVALU EITHER BEFORE OR AFTER HIS C21NI OPERATION IN NOVEMBER. QSL TO HIS HOME CALL.

VANUATU, YJ. OH1RY WILL SIGN YJ0R IN CQWW CW THIS NOVEMBER.

WAKE ISLAND, KH9. THERE IS STILL TIME TO QSO AA4NP/AH9 ON 20 OR 40 METER CW. HE HAS BEEN VERY ACTIVE FROM 1000 TO 1100 UTC, BUT WILL QRT SOON.

WEST KIRIBATI, T30. THE BANABA CREW MAY ACTIVATE TARAWA FIRST. IF THEY DO, IT WILL BE A LIMITED OPERATION FROM NOVEMBER 3 TO 5.

ZAIRE, 9Q. 9T5E IS THE CALLSIGN SIG, 9Q5EE, WILL USE FOR CQWW SSB. QSL BOTH VIA K1RH. RALPH CAN ALSO CONFIRM SU1EE CONTACTS BY SIG.

SPRATLY ISLAND, 1S. DESPITE THE SUPPORT OF INDEXA, ROMEO, 3W3RR, IS STILL LACKING ADEQUATE FUNDS FOR HIS RETURN TO SPRATLY IN DECEMBER. CONTACT NT2X FOR DETAILS. AR

Other stuff deleted.

Mr. T.S. Kelso, PLEASE continue the format that you have been using.
Almost ALL Amateur and NON-Amateur programs for tracking satellites that
I know of use both the AMSAT and NASA/NORAD format.

I FOR ONE do not want to cause YOU, Mr. Kelso, any more work than you already so unselfishly provide to indviduals who use your NASA/NORAD postings of the NASA/NORAD format of the Keplerian values.

When the 3-line format you post, Sat Name, and 2 lines of Kep data would NOT be immediately consumed by ORBITS III (Mr. Roy Welsh, a nice program), I wrote a simple conversion program in BASIC to provide the required conversion.

I greatly appreciate Mr. Kelso's postings here as they save me a long distance call to his BBS, which, sadly for me is no longer in Austin. A long distance call from Finland, I assume, would be MUCH more costly!

I do not know the formulae for deriving the info found in the NASA/NORAD format that is needed for folks with 'AMSAT ONLY' capable programs. Perhaps someone who does can post them and that should resolve Mr. Tigerstedt's problem; and I'd kind of be interested in knowing them as well. :^)

> "I have only come here seeking knowledge.

...in a format that I can understand?

License or not (and I'd tend to guess not), Karl should have no problem "working skip" from buffalo with 40 watts SSB. I've worked many people using barefoot (i.e. 25W) HR2510s in mobile installations, even some from upstate New York (Niagra Falls). 10m is one of those bands; when it is "in", 5W is plenty to work transcontinental. Sometime tune in the CW beacons from 28.200 to 28.300; you'll hear 2 to 5 W beacons all over the US. Of course, knowing CW helps one identify which beacon is being received ;-).

**** UoSAT-OSCAR-11 BULLETIN   06 November 1990 ****

UoSAT MISSION CONTROL CENTRE
University of Surrey, Guildford, Surrey, GU2 5XH, England

** AO-16 / UO-14 BBSs COMMISSIONED **

The Packet Bulletin Board software which has been running in 'beta test' versions on UoSAT-OSCAR-14 since July has now been loaded to AO-16. This follows a period of intense development by Jeff Ward, G0/K8KA, and Harold Price, NK6K, getting software ready for hundreds of users expected to access AO-16 and UO-14.

The programs loaded to the satellites, when combined with several groundstation client programs, implement the PACSAT communications protocols proposed by Jeff and Harold in papers presented at the recent ARRL Amateur

Radio Computer Networking Conference. The protocols provide a connected-mode file transfer facility called FTL0 and a standard broadcast mode for bulletins and other items of general interest.

When someone is up or downloading in connected mode you will see packets from the FTL0 server callsign: PACSAT-0 (on AO-16) or UOSAT3-12 (on UO-14). Bulletins being broadcast will have source callsigns UOSAT3-11 or PACSAT-11. These packets may contain some ASCII text, although each will begin with a short binary header.

The PACSAT protocol suite requires special groundstation software to interpret binary headers and implement protocol handshakes. Papers in the 9th ARRL Networking Conference proceedings describe the protocols in detail. Software for groundstations with IBM-PC type computers will be made available free by UoS through dial-up bulletin boards and on-line information systems.

The release of the groundstation software, expected around 8 or 9 November, will mark the official opening of UO-14 and AO-16 for communications by any suitably-equipped, licensed radio amateur. With LO-19 following stortly and FO-20 already providing service, the Amateur Satellite Service will soon have a useful and interesting network of store-and-forward satellites.

** RS-14/RUDAK-2

Reliable sources within the Soviet Union indicate that the launch of RS-14/RUDAK-2 is now expected to happen on or about November 24, 1990. UA3CR requests the help of radio amateurs all over the world to collect telemetry and send it via packet radio or via a SSB net to him. The first day's worth of telemetry will transmitted via a CW beacon at 20 WPM on 145.822 or on 145.948 MHz SSB and will be vitally important to ground controllers. Later, after ALL systems are working properly on the RUDAK-2 transponder, PSK/BBS/MODE B operations will begin.

** AO-13

The transponder schedule is as follows:

Mode B : MA 000-095
Mode-JL: MA 095-125
Mode-LS: MA 125-130
Mode-S : MA 130-135
Mode-BS: MA 135-140
Mode-B : MA 140-256
Omnis : MA 220-040

This schedule is expected to continue through 26 Dec 90.
BLON = 180 and BLAT = 0

** $BID **

Please use BID $UOSAT.105 for PR BBS use.

/EX

I'm trying to design some simple front end antennas, filters, and amplifiers to improve my reception of shortwave broadcasts. The problem I run in to is that I don't know the input impedance of the Sony 2010 radio I intend to use. There is nothing in the specification sheet of the radio that tells me what I need to know. Any ideas? I plan on using the external antenna input jack to provide the desired signal.

A similar question exists for all radios out there. Is there a standard impedance for consumer shortwave radios?

+
+If you take it to the FCC lab and get it type accepted, yes.
+

None of the existing Amateur gear could pass..the controls allow for other than fixed-transmit frequencies. The power output is adjustable above the limits, the modulation can be run above limits, most rigs have FM - a mode that is illegal...nope, you couldn't get it type certified; it just won't qualify! The rules were designed to force the manufacturers into selling radios without those capabilities, and of such design that it is difficult to add such capabilities...like why do you think that Dynascan/Cobra keeps on making the Cobra 148GTL??? Because it's *very* easy to modify...and that's why people keep on buying them! Because of the way in which the rules were written, once a design is type certified so long as there are NO CHANGES, the company can keep producing and selling them..if they change something it's a new set of rules! The latest set insists on making it damn near impossible to modify the rig for increased frequency coverage (the '148 can go from 26.965-27.405 to

26.815-28.045 with just 3 silly jumper wires and 3 switches added to the existing PLL!) more power (the '148 can be turned up to almost 20w PEP SSB and 10-12w RMS for AM use!) or additional modulation modes. (again, the '148 can be made to do FM by adding a little kit that costs $20!)

In addition, it's pretty obvious that the manufacturers would rather sell millions of radios than thousands...hence they decided to do both by building units like the HR-2510/2600 - Ham radios...sure! A simple jumper, a cap or a new PLL chip and either of those units can operate on 26.00-30MHZ...presto! ..no type acceptance laws to worry about! It's NOT a CB! Yeah RIGHT!

The FCC hasn't got the time to bust hams for running their gear on 11 meters, and your risk-factor is small PROVIDED:

1) you DO keep it turned down to 3 or 4 watts RMS - otherwise you stick out like a sore thumb! Just like the guys that run linears only cleaner! ..if your antennas are really good on 10 & 11, crank it down more!

2) Watch your modulation % - most stock CB's have 65-70% max...a preamp mic (I use the Cobra Dynamic Plus..) turned DOWN to 2 or 3 will make you sound pretty much like a *verrrryyy clean* CB radio...most amateur mics sound pretty awful on AM..great for SSB but thin or hollow on AM, especially if the people listening to you are listening on CB receivers..which are not the greatest!

3) AVOID THOSE "funny freqs"...lot's of CBers insist on using the band between 27.405 and 28.0 You (as a HAM) should never operate there! You could lose your license in a flash! Most CBers never get caught..but I've know some Hams that have! A word to the wise...if they ask, just be cool..tell 'em you don't have "freqs"! Stick to the 40 channels...plenty of people to talk to there, besides some of the freebanders have been known to use their equipment for illegal acts - something you'd just hate yourself for if the FCC nailed you and decided that you were in on it!

4) You don't cause problems...TVI, RFI and the like, even complaints from other 11 meter users can be the catalyst for a complaint. Remember that most of the people on CB are non-technical, they tend to carry around a lot of misconceptions about the science of radio...don't abuse them for this: TEACH THEM! ONE AT A TIME! INVITE THEM OVER (if you trust them..) AND OFFER TO LET THEM BE A GUEST OPERATOR! YOU'LL BE AMAZED! Some of them will be so jazzed they'll go out and get a Novice ticket with a little encouragement from you! (I'm rather proud of the 12 people I did this with - they're good hams, they wern't bad CBers...)

5) Keep a low profile! The FCC is sooo overworked, and sooo underfunded it's unlikely that they will be doing much about 11 meters any time soon. They'd probably like to just ignore the problems there unless there is a reason to do otherwise...like those clowns that shout obscene remarks into their mics..or run a gallon of power...if you're cool about it, no one will ever know you're running ham gear..unless you tell them! And if someone *does* ask..tell them you're running a Stock Cobra 148GTL with a power mic!...there's millions of those things out there and it won't

arouse a bit of interest..

T2FD antenna - it actually stands for 'Tilted Terminated Folded Dipole'.
I dont understand the theory, (its for HF bands - i dont *WANT* to understand the theory!) but i do have various references to it in some ancient 1950's books i can dig out; - anybody interested?

CEO summary:
A message recently requested that the "actual" Keplerian elements be
posted to the net instead of the "two line format".
I'd like to thank Dr. Kelso for his reliable postings of the latest
elements (along with a format description). It's been several years
since I first started getting Info-Hams and Dr. Kelso has hardly
missed a beat. I believe the two line format is quite sufficient for
two reasons. First, Instant Track software loads it automatically and
second, it takes up less space on the digest than the longer "AMSAT"
format.
Again, thanks to Dr. Kelso for providing a most valuable service.

Check into Europe, or Japan, or about every country other than the USA.
They have no-code licenses. As far as I know, all with positive effect.
In fact, at least in Holland, there are more no-code licenses than
code-full licenses.

This point has been made in the past. Usually, one studies a few months
on the subject before making a decision. Where were you?

Why? Myself, I have a no-code license, and yet I am allowed to use CW
if I like. The only requirement is that I ID. However, if my CW is bad
enough not to be copyable, ID in phone is perfectly legal within
my license. Some people use this possibility to study CW after they got
their no-code license and they decide they want a full license after
all (a very popular grow-path).

The need to know technical stuff is because 1. you need to know about
radio to successfully use it within the spectrum of modes the ham license
provides, and more important 2. you need to know about radio to lower
the chance that you cause disturbance to others, especially using
the (e.g. high-power) privileges your ham license provides.
If ham-radio were just low-power FM phone, radio knowledge
would be less required, but at least _you_, being a ham,
 should know what your transmissions can do to the operation
of neighbour's stereo :-).
That is why you may use modes what are more likely to cause
disturbance (SSB) and higher output levels.

I guess that if you burn up electonic parts in the experimenting process,
the {FCC, PTT, RTT, DBP, ..} will probably feel sorry for you, but you
probably learned from it in the process. You didn't harm others.
They wouldn't mind you burning some parts.

On the other hand, you should know what to do to make it very unlikely
that your just-built new transmitter doesn't home planes to your backyard

instead of the nearest airport.
Pirate transmitters built by people without radio knowledge tend to have
some nasty side-effects.

>   2. The international treaties governing radio demand it for activity
>below 30 MHz. As all current ham licenses have privileges below 30 MHz,
>it is required for all current ham licenses.

That is why many US pro-coders suggest a no-code [vus]hf-only license.
If only >30 MHz is allowed, morse code tests are not required.

My personal feeling is that these no-code licenses are very useful,
and have proven the concept for at least 30 years here.
I think it is time for the USA to come by to the rest of the world.

10 meters was just as bad. For most of the afternoon, it was virtually impossible to copy packet as the 50 over 9 CW stations completely blanketed the S5 packet stations. Other than the blatant interference that is common during contests, makes you wonder what happened to "use only the power necessary." If CW is so much more efficient, why do CW ops run so much more power than the packet stations??

I wish there were at least one weekend without a contest. There are other uses for the spectrum, and I work all week too.

|
| I could suggest using the sound input on the new Macs or an equivalent
| (Mac recorder from Farallon) for the older macs, Then digitally process
| the signal to get the code out of it and then decode the morse.
|

Interesting but the Mac is probably a poor DSP ;-)

| Personnally I would demodulate the audio externally and feed the resulting |
digital signal to one of the handshake lines of the serial port and do only the |
morse decoding in the mac.
|
| I know nothing on algorithms for morse decoding but would like to have a
| look at that.

I'm experimenting a morse decoder whose harware part is built on a home-made fax demodulator : a tone decoder feed one of the 8 bits of the parallel/serial converter used for the fax signals. The serial words are sent on one of the Mac serial ports

Regarding the folded dipole with a terminating resistor (T2FD) ...

Remember that a simple 50 ohm resistor will give you a VSWR of 1.000 on all parts of all bands.

Give me an antenna with lousy VSWR. At least, if I tune it a bit, it will radiate!

I am posting this for WD1V, the moderator of Macnet.
Please do NOT respond to this account.

Macnet is FREE and available to all. What WD1V has done is put together, via packet radio,is a list of hams throughout the world who use Macintoshs, so that they might converse about Macs and ham radio. He also maintains a Macintosh public domain software base for ham radio. Currently, the base is about 10 Megs! The following is his Invitation to Macnet as well as a list of the public domain software disk names. Send a SASE with a FORMATTED disk for the Macnet general info and the list of hams which WD1V has compiled. For each disk you want,send the disk name as well as a FORMATTED disk and SASE.

As soon as you send your stats in, you are a member of Macnet.

I would like to thank John WD1V for his efforts to bring together the Macintosh Ham community. He has done a very good job.

Please do NOT respond to this account. Contact John WD1V via packet radio at
WD1V@KB4N.NH.USA.NA, or send a letter to the address below.

John Kingdon KA3VJH

INVITATION

Well, during the the CQ WW RTTY contest RTTY was in the "AMATOR" band
segment and in the top end of the "CW" band. On 40 meters, the DX
window for RTTY is at 7.03. I have worked European stations there.
The ARRL RTTY Roundup tends to spread out of the "RTTY" band a bit
also. Seems to be some give and take here. Legally CW can be worked in
the entire band.

John,
You probably will find that good cable is far cheaper than a remote base.
for example, running a RG213 run of 1000', you can probably buy the cable
in those lengths for 300 to 500 bucks...

I have set up a remote base on 440 MHZ (actaully repeater / remote base, 442.150)
and it controls my antenna selection, rotor heading, tunes up, down, etc.
selects all modes, the whole thing... ok, so how much $$$?
repeater: about 1k, controllers for repeater, remote base, etc. $2K,
antenna for repeater 400 buck, etc. etc. plus a lot of time getting it all
working.

It works great, and others can benefit from it, but I do not think MOST people
would spend that sort of money and effort when a less than 1000' run of low
loss cable would do it...

on VHF/UHF, you may want to look at a nomograph to compare line loss vs. height
gain, plus see the "blind side" of the hill....

If you want more details on the remote base solution, it can be done cheaper;
I have a friend who did his using a c-64, homebrew repeater, etc., and his is
cheaper, but would still be more than the cable, higher time investment,
more maintenance, etc.

even with off the shelf components, it is not a plug in and play solution...

cheers
Dave

This may be a dumb question, but is there any reason to modify a CB to use FM?

According to the survey in the NCJ last quarter, it was only something like 3%
(I'm trusting my memory here, so be gentle) of the contesters that use Mac's.
Not enough of a market to make it worth anybody's while! I guess individuals
(as opposed to businesses) just object to having to pay Apple 2x the price
they would pay for a clone with the same power. Then there's the business of
getting your mouse cord wrapped around your paddle cable and ending up with
mouse droppings all over the log :-) !

>but can't understand Tagalog any better than they can Morse code.

I was imprecise. The auditory system doesn't include the signal processing equipment on the back end, so in that sense, you're right.   However, our signal processing equipment is trained for speech and not CW; there may be a few individuals out there who use CW more than they speak, but I wouldn't bet the farm on it.

>So one might be able to actually hear both speech and CW frequencies with
>equal ease, but I submit that it is easier to mentally "tune" the auditory
>system for a single frequency under weak signal conditions than it would be to
>tune it for the entire speech frequency band. IMHO this is the analogous to
>peaking a tuned circuit for a single signal instead of flattening it into a
>broad-banded device.

Again, this is probably true for signal DETECTION, but not for DECODING. First of all, human beings make use of intonation and inflection for some information, much of which is redundant. More importantly, though, is that the symbol time for speech is much longer than for CW. This is critical in a Rayleigh fading environment, where you have short deep fades.   Those short deep fades completely cover one or more CW symbols, but only part of a word (arguably, part of a phoneme). Above 30 MHz this isn't the case, since Rayleigh fading does not predominate the way it does at HF. Here again, CW does have some merit, although much of it is lost in lousy wide filters.

Hi,

I posting this for a friend, who has no usenet access.
On the 5 nov. 17.40-17.50 Zulu, moving from North to South direction, a
satellite burning in the athomosfere.

Is there somebody on the net, who can confirm this ?
Did we lose a amateursatellite ?

It also may melt.

I don't know about the t2fd, but if you peruse the ARRL handbook, you can find nonresonant antennas with 10+ db of gain even after accounting for loss in the terminating resistor. They are a bit large to be rotatable, but if they are pointed in the direction you want they should work well. In some cases they can be remotely switched from resonant to non-resonant modes just by putting the termination on a relay.

You might want another antenna for a specific band, but to me it is worth giving up 2 db in return for something that will load up anywhere from 160 to 10 meters with no hassle.

Great! Could you please post it to the net? I'm sure that there's many others who are not unix wizards who would also like to know how to do this. Let the muttonheads argue among themselves and leave the rest of us alone!

I recently purchased an old Johnson Matchbox, Jr. Unfortunately, no manual came with it. Does anyone have a manual for it, or its big brother, or know where to get one? I'd be willing to cover copy costs and provide SASE. Thanks.

Well, Ham RADIO is, in fact, old men (young men, old women, young women, even children) playing with radios. That's why it's called amateur RADIO, IMHO.
Bob West issued a challenge in a recent posting to define the "new image" of amateur radio. Let's see your idea of how the image ought to be reversed.

Will it be amateur radio, wireless computering, what?

>Is it a bug on those HTs or it can be solve by some modification?

For what it's worth, I tried the above on my Icom IC-2GAT, serial number 02880. The offset step size can be as low as 5 kHz; the step size when setting it matches the VFO tuning step size. Thus, if your tuning step size is at 25 kHz, your offset step size will be 25 kHz.

Of course, the 2GAT is (as far as I can tell) a totally different creature than the 24AT or 2SAT...

>Besides, computer hackers can make more money in their spare time by
>hacking computers than by using _Amateur_ (read "non-profit") Radio.

I repeat a point I made in the past. Morse is a marketing disaster.

I work at an establishment that designs advanced computer networks, including hardware, software, protocols, etc. This place is lousy with EEs. Yet I have met very, very few people interested in getting started in ham radio for the first time. A few have gotten licensed again after years, or after being interested as kids, but few "virgins".

Sometimes people begin to get interested. Then they inevitably ask the question, "Do you still need to know the morse code?" Given that the answer here is still "yes", they immediately lose all interest.

I sometimes say, "But the FCC has indicated that they'll probably drop it soon". They then suggest that they may become interested after that happens.

These aren't spoiled wimps. They just don't want to waste time learning an antiquarian skill as a hazing ritual. If you want to communicate, the Usenet is zillions of times faster and more reliable than ham radio will ever be. They want to hack, but feel that the hazing code makes a fool of them.

And I'm a CW operator, so don't give me any crap about my own lack of effort. I like to _use_ CW. I just don't like to _require_ it.

> Why has the posting of keplerians lately ceased? A couple of months ago we still received regular postings...

From comments I've seen, more people actually prefer the 2-line elements. For one they take up WAY less space when trying to exchange them over packet links. Also, most of the current tracking programs have the ability to directly digest the 2-line elements and automatically update your entire satellite database. For those who absolutely need the long-form elements, there is a small program called "eletrans" that converts the 2-line elements into the standard human-readable output.

I also appreciate the postings. I forward them locally to a few packet BBS's and I'm always receiving comments to the effect of "more, more!" :-)

John

I have a distinct bias towards experimentation rather than contesting or DXing so I may be out of step with a lot of folks on here. I think of amateur radio basically as a place where one can learn through experimentation and self study about electronics and radio. Amateur radio led me directly into my professional work in broadcasting. I would hope for an amateur radio that can lead other young people into technical careers.

The problem with amateur radio today, as I see it, is that the entrance requirements are no longer relevant to the type of electronic communications that people are interested in today. This is the primary reason that I support a no code license. When I was first licensed in 1964, I struggled through the code because it was one of the two major modes of communications in amateur radio. The other mode was AM. AM is mostly gone. Today the code is only one of a multitude of communications methods used in amateur radio and is hardly used at all in the VHF/UHF bands, except by a few DXers. Most of the experimentation with new modes and techniques is happening at VHF/UHF. Packet, fast scan tv, digital voice mailboxes, satellites, radio control, spread spectrum, digital video, and many other techniques are being spawned and being used at VHF/UHF/SHF. To me, this is where the excitment in amateur radio resides.

I believe that amateur radio can have a bright future with many different interests being represented. I expect that digital techniques, of which today's packet is just a forerunner, will be a major part of amateur radio just as it has become a major part of all electronics. I don't expect it to become the sum of amateur radio however, radio communication is too broad a field for one technique to dominate. I expect to see cellular techniques adapted for mobile amateur use. I expect to see an increasing interest in amateur video including slow scan, fast scan, and new high definition techniques. We have the spectrum to do some groundbreaking experimentation in leading edge techniques. What we must have is the critical mass of people who are excited by these techniques and have the motivation to experiment with them.

I believe we can no longer promote amateur radio as a way to "Work the World". With competition from cheap long distance phone networks and from cellular telephone, working the world doesn't seem the big deal to today's youth as it did to me twenty six years ago. The world no longer seems the mysterious place it did then. Television satellites have made the world a global village with routine live pictures from all over the globe available every night in our living rooms. We must present amateur radio as the place to be to play with all the exciting new toys of the electronic age. One of the most painless and effective ways to get people to learn is to get their interest in doing something up, then they will seek out ways to learn what they need to know to play. Kids who are interested in baseball can spout endless facts and statistics about the game, not because they were required to learn them for a test, but because they were curious and wanted to know. Similarly, if a kid is excited about some facet of radio, he will learn all he can about the subject, not to pass a test, but because he wants to know. I hope we can fasinate these kids with the neat new things we're doing with radio without turning them off with too much historical baggage.

Gary KE4ZV

I think we should modify the written test in the following way: send
the questions in CW at 5 WPM. Then if you can copy, you can answer the
questions. Perhaps, for many, this would be the same as a place out
in the country we like to call "hell".

>None of your points constitute valid arguments against a codeless license,
>although you are perfectly free to promote voluntary proficiency in or
>use of CW by anyone who will listen.
>
>Phil

I read the Reply Comments and the string that followed. Most technical
rebuttals were re-rebutted. However, there were rebuttals that dealt
with more practical aspects of the hobby that went unanswered. I'm
pursuing one of them here: "DSPs on every Bench".

Phil's love of DSPs makes me want to believe that this may be a magnet we need for this hobby. DSPs bridge the gap between computers and communications, especially radio. If we can get enough of the basement PC hackers to take up DSPs and a Novice license, higher usage of all Amateur frequencies is likely, but especially [vus]hf, which would help the WARC situation.

What I know of DSPs would fit on an index card. How do laymen discover how to use this technology, or is it only for the wizards at Bellcore :-) ? Is there a "DSPers Workbench" ? Are there plug-in cards for my PC ? Are DSPs as easy to program as Apple][Basic ? Do I need a Ph.D.EE to use one effectively :-) ? Given Phil's employer, I suspect that all this comes to him rather naturally. However, the arcane technology and tooling is a barrier to widespread experimentation.

These are the questions, if answered, that could unleash the masses on DSP technology, and maybe (just maybe) one of them might get lucky and invent SSB while the rest of us are puttering with AM.

For the right price I can be located in Wyoming. :-)

Seriously... Fort Collins, Colorado is just a 1/2 hour drive south of the border. Someday if'n I'm bored enough when the band is open, I'll drive up there with my 25W HR2510, mobile, and a stack of postcards. Ought to be fun for a change on the receiving end of the pileups.

Nobody actually LIVES in Wyoming, you understand. It's all barren wilderness.

(Now if someone from Wyoming wasn't going to respond before, I think I probably just got their attention. :-)

Good luck --

Subject: Letter from Yaesu about FT411

Last June I bought an FT411. In October I wrote a three page letter to Yaesu to share some kudos, gripes, and suggestions about the unit. (Send me mail if you want a copy.) To my surprise I got a very nice, detailed reply from the manager of their public relations department. I'll share some of the highlights.

* Starting with production lot 17, the FT411 is called the FT411E. "The major difference... is improved receiver performance at frequencies far from the amateur band, accomplished not by varactor-tuned filters, but by changing capacitance values in the front end filters..."

* The IF was increased "from 16 to 21MHz". (Curious, I measured mine at 17.3MHz.) The changes to the IF unit are apparently too extensive to retrofit.

* Many of the points I raised "are addressed in new models to be announced soon, such as 15-KHz channel steps, better lamp control (the new models will have both always-on, and 5-second modes), an external 13.8-V jack (new models include a built-in charger!), and simplified keypad locking."

* "...watch for multiple selectable low power steps in new models."

* "The need for a DTMF memory display and better low battery indication are known to the designers, but it is too soon to know..."

* An internal SWR meter is unlikely; perceived need is low.

The reply did not address some of my suggestions:

* How to shift up the center of sensitivity?
* Left side button ergonomics.
* Squelch control too close to antenna.
* Documentation on robustness with high SWR.
* PRI channel locks in unexpectedly.

* More documentation on optimal NiCad use.
* Different beeps going to/from Call channel.

You're taking it all much too seriously. Flaming should be thought of as a bloodless form of combat sport. Sort of an electronic paintball, as it were.

Provided nothing. There is no way to police the 10 meter band. As long as they sell the radios the band is lost to hams.

>
> 5) Keep a low profile! The FCC is sooo overworked, and sooo underfunded
> it's unlikely that they will be doing much about 11 meters any time soon.

They won't be doing anything soon. The solution according to a fellow New Hampshireite in the current administration is to do nothing long enough for the QRM on HF to get bad enough for the media to notice it. The congress at the urging of the administration can then step in with public support and pull the plug on all, and he says ALL HF transmission. Mr HIGH UP in the POWER STRUCTURE knows I'm a ham and he said with a shrug that there will be no way to clean all private use of HF off the bands without including hams. The plan is to ban ALL private transmission. Then they don't have to go after specific violators

they can just swoop around and RDF the easiest violators..by the thousands..
if necessary and pass out big,and he said BIG fines. No jail..no room, but,and
these are his words...."The fine structure will allow a self-sustaining police
action to continue as long as necessary without departmental fiscal impact."
When I brought up the failure of the drug war he laughed and said "drug dealers
are mobile. They are like rats. They hear you coming and can hide. And they
don't have a lifestyle that can be damaged by big fines. You radio
types live in houses and drive cars that can be attached along with your
paychecks. Your lives can be destroyed by being caught on the air by a van
with a couple of guys and the 'probable cause' of RF coming out of your house."
And then because we went to college together and have been friends for a long
time he said,"Sorry Dickie, we need the room, we need the money and the
pressure from the commercial sector is building. You hams did a great job when
we were young but there is nothing you can do now that is so valuable to the
public that they can save you. I'm really sorry".

Then I asked about VHF/UHF and he thought that was really funny.

Porky said it all...."That's all folks"

My 'umble opinion is that the Uniden/Radio Shack ten meter offerings are an
attempt to cash in on one or both of:

* the sunspot cycle

* the ten meter sideband privileges for novice and tech ops.

I'm not going to buy one... I'd rather buy a five bander so I can concentrate on getting my CW up beyond about 7 wpm. However, when the sunspots go away, I hope to see the street prices of these Unidens drop like a stone, and I hope to be able to pick one up (either used or overstock) for a song. Then I stick it on the shelf for the next time old sol does his thing. Opinions?

I think I have the perfect solution.

Access to the CW part of the spectrum should be permitted only to those who know the Morse code.

Access to other parts of the spectrum should be permitted only to those who have the appropriate skills. E.g., only people who can speak should be allowed to use phone, only people with functioning EME equipment should be allowed to bounce off the moon, etc, only people with working 2-meter equipment should get to use that band, etc.

It's silly to require people to learn the Morse code in order to just be allowed to talk.

]
]So, are you saying that all automatically controlled 2 meter repeaters
]with an autopatch are not legal?

Autopatches carry third party traffic. Thus, they require a control
operator. See 97.115 (of revised part 97) - for discussion see page
10-3 of The FCC Rule Book, 1990 (ARRL).

It is not clear to me, under the new regulations, if the user of a
repeater operating above 2 meters can be considered the control operator
simply due to control on the input frequency. Under the old rules, the
control had to be exerted on a different frequency, which somewhat limited
that ability of the user to control
it. I see no prohibition under the new rules to controlling on the
input frequency, although the requirement to "use an auxiliary
station" for radio control may require another frequency. It is
clear to me that an autopatch CANNOT be controlled only via a 2 meter
frequency - there must be an auxiliary station, and auxiliary stations
can only operate above 1.25 meters.

Anyone know a clear interpretation of this confusing mess (ain't
"plain english" rules great?)?

The three open autopatch repeaters in Phoenix, operated by the Arizona Repeater Association, all use telephone control on a separate line than the patch audio line. One of these uses an ACC RC-850 controller, and when we called ACC and asked them about using the second line for patch control, they said they had never heard of anyone doing it. I suspect that most autopatches are illegal and have no control other than on a 2 meter input frequency.

I don't think the FCC would look upon that as being any different than
a radio remote control, since that *IS* what it is. The AUXILIARY rules
must be followed for it, such as frequency limitations.

The manual for the Matchbox ("all models", it says) is available for
$8.25 from:

Hi Manuals
P.O. Box 802
Council Bluffs, IA 51502

They have manuals for most old ham gear. Their catalog costs $2.
They prefer money orders to personal checks.

Can anyone tell me the whereabouts of an UP TO DATE FTP site for W0RLI and
the G8BPQ code and associated utilities.
Pls reply to xtasc@lv.sait.edu.au
thanks in advance .... Rob VK5ZEU

Wally Blackburn asks "are there tradeoffs between tighter filters and wider ones ...? "

Yes, Narrow ones get rid of the QRM, but they tend to ring, which makes high speeds hard to copy. I find it easier to learn to ignore the QRM than to copy through the ringing.

Hi:
I saw your posting to rec.ham.radio / info-hams. I have a subscription to the Spacewarn Bulletin of the World Warning Agency for Satellites. They list recently decayed satellites in each issue. I'll check the next issue when it arrives (monthly) and let you know what I find for 5 November (I presume the sighting was in Holland and not in the U.K. where Guy Fawkes day is celebrated on 5 November with lots of fireworks).

According KR2Q, a member of the CQ Contest Committee and also a frequenter
of the YCCC PacketCluster (tm), Y2 (E. Germany) will tentatively be counted
as a separate multiplier for the SSB WW contest *only* (the one just
passed). It will not be a separate multiplier in the CW contest at the end
of November. Fix those CQWW.CTY files now!

I'd second the suggestion of open-wire line. Also look at G-LINE if you want UHF.
It is also a common thing for people to use mast-head preamps and occasionally masthead poweramps. If you use a remote PA on HF, you will also need remote control of lowpass filters and perhaps a remote or automatic ATU. Our local club has an ex-RAF radio site, dry gas pressurised co-ax went for miles over the hillside. It had a solid Al outer tube, a helical support membrane and a 1/8 inch solid copper inner. Unfortunately the forestry comission ploughed drainage channels so it is all defunct.

If my memory (grey sludgy type) is OK, I read in an old (1985?) qst that the ICOM r71 loses its marbles when the lithium cell is shorted or just plain dead. The writer said that he could not get it re-programmed in the US, It had to go back to J-land.

No equipment reviews cover this topic. Should we start a listing here on the net of which sets are at risk ?

In a few years, when the cells begin to fade, some brand names are going to have a bit of an image problem.

Fortunately for me, I run antiques on VHF and homebrew/surplus on HF, but other people could become the owners of surprisingly expensive component collections :-(

How about after-market firmware as a business opportunity :-)

I don't know which brands/models are risky, but I've heard enough rumours to make me curious. Let's find out so that the odium can be focussed only on the guilty.

Here's some info on the IC229A/H, (indirectly) from ICOM:

The stock radio has RX: 136 - 174, TX: 140-150, FM only.

When diode D5 (conventional, upright diode on the logic board)
is cut, 118 - 135.995 MHz can be received in AM mode.
[Local reports indicate the audio is acceptable but not as good as,
for example, AM received on a PRO-2004 scanner]

To expand TX to 136 - 174 MHz, locate chip diode D9. Ascertain that the vertical pair of pads to the right are OPEN. Short the next pair of vertical pads to the right [with solder, perhaps].

These changes pertain only to the USA model.

Here's some ASCII art to clearify:

```

I have read in ham magazines that the black variety of PVC is not
suitable for RF applications but the white kind is suitable for
structural use at VHF. One way to test relative RF absorption is to
put samples in a microwave oven and see if they melt.

In article <610@nih-csl.nih.gov> gmc@helix.nih.gov (Gordon Charrick) writes:

> Hello everyone. I just recently bought an Icom 24AT. It's a great little device, especially when you open up the receive range. Anyway, the reason I'm posting is because the antenna that came with it basically stinks. From inside my house I can't hit any repeaters and the reception outside the ham bands (at least in the 138-170 range) is pretty bad. I can barely pick up the fairly strong 162.55 weather station at all. I went over to the ham store last night to find another antenna and they recommended one from Larsen (rubber duck also). They wouldn't let me try it since it was in a sealed bag. I was wondering if any of you out there have any recommendations for dual band antennas for this critter. Also, do all the 24AT's have such lousy antennas or did I just get a bum steer?

The supplied antenna is just about useless on 2m. The 440 preformance is average. It really loses out of band, like for the wx channel. I noticed this as I put the antenna from my u2 on it and noticed a big difference. The supplied dummy load seems to be as good or better then any of them on 800 MHZ.

The local HRO here let me try them all. The one I ended up with is a Diamond "buggy whip". It has really great performance on 2m, better than the larsen and MFJ(??). The 440 performance on all of them seemed about the same in my crude experiements.

The diamond "buggy whip" seems to be a nice antenna but be warned that it is almost 1.5 feet long. Also, being a Japanese antenna it is made for 2m and *430*, not 440. For an HT this didn't seem to be too much of a problem but be careful buying Diamond antennas for UHF. I know people who have been burned by "bargains" on Diamond dual band antennas for base use.

Another way is to remove the racks from your dishwasher and run the chassis through a cycle or two. Works wonders for me.

I am posting this for a ham friend who doesn't have net access.

Please repond to me and I will give him the answer.

My friend is currently living in "4 land" and will be moving to Chicago (9 land) next month. He knows he has to submit a 610 form to the FCC to change his residence and station address.

Can he check the "change call sign" box on the 610 and get a "9" call at the same time? (Apparently his "4" call has bad connotations.)

```

Along the same lines, is there (via anonymous FTP or something?) an on-line list of all the "Q" (and other) codes? I know this info is available in printed form (and I'll doubtless see it when I start studying for the Novice exam), but I was hoping for an on-line version.

I'm slowly working myself up to trying ham radio, and I miss a lot of information content in this group by not knowing the code letters. Are they used only in Morse, or do people actually use those codes when doing voice also?

By the way: yes, I would be more inclined to get into Ham if I didn't have to learn Morse (I actually want to use packet radio mostly, maybe phone patching too-- Ham seems like the last great communications bargain). Not that I mind learning Morse mind you (it's a challenge, and 5 wpm seems very easy to attain)-- I keep thinking of situations where knowing Morse would be useful:

1) If I'm ever thrown in prison, I can communicate secret messages with the other inmate who knows Morse.
2) If I'm in a plane with the radio out, I could communicate to the tower by flashing the plane's lights-- assuming someone in the tower knows Morse.
3) After a nuclear war (when all our electronics will have been wiped out by the EMP), I having a fighting chance of building a Morse-code-only radio (can you say, "spark gap?").
4) I like knowing obscure things.

Please take these last comments as tongue-in-cheek, humorous ramblings of a deranged person and don't pick me apart.

P.S. One final question: What is the minimum license needed to do packet radio? I know I can pass Novice, and probably Technician (but not anything with a higher code rate, *sigh*).

Thanks!

-Eric

DX BULLETIN 45 ARLD045
FROM ARRL HEADQUARTERS
NEWINGTON CT NOVEMBER 9, 1990
TO ALL RADIO AMATEURS

THANKS TO ALLEN, N2KW AND THE TRISTATE DX PACKETCLUSTER NETWORK FOR THE FOLLOWING DX INFORMATION.

AS NOTED IN THE NOVEMBER 2ND ARRL BULLETIN, ARLB044, THE ARRL AWARDS COMMITTEE HAS ACCEPTED THE FOLLOWING RECOMMENDATIONS OF THE DX ADVISORY COMMITTEE. EFFECTIVE OCTOBER 3, 1990, THE GERMAN DEMOCRATIC REPUBLIC, Y0 THROUGH Y9 IS DELETED, BECAUSE THE COUNTRY WAS ABSORBED BY THE FRG, FEDERAL REPUBLIC OF GERMANY, ON THAT DATE.

EFFECTIVE MAY 22, 1990, THE PEOPLE'S DEMOCRATIC REPUBLIC OF YEMEN 7O, AND THE YEMEN ARAB REPUBLIC, 4W, ARE DELETED. IN THEIR PLACE, A NEW COUNTRY, YEMEN 7O, IS ADDED EFFECTIVE MAY 22, 1990. MARCH 1, 1991, HAS BEEN SET AS THE EARLIEST DATE FOR SUBMISSION OF CARDS FOR CREDIT FOR THE NEW YEMEN LISTING.

BANABA, T33. BLADUR, DJ6SI, HAS BEEN ATVE AS T33X. TRY 28025 KHZ AT 2230 UTC AND 21025 KHZ AT 0000 UTC. T33R HAS BEEN ON 28480 KHZ AT 2230 UTC AND 14195 KHZ AT 0400 UTC. T33T HAS BEEN ACTIVE ON 21003 KHZ AT 0000 UTC, 7003 KHZ AT 1000 UTC AND 14022 KHZ AT 1300 UTC. QSL T33R AND T33T VIA OH3GZ. QSL T33X TO DJ6SI AT HIS CALLBOOK QTH.

BANGLADESH, S2. THE S21U JA TEAM HAS NO IMMEDIATE PLANS TO RETURN. S2VT BY K5VT IS RUMORED FOR FEBRUARY, 1991, THIS TIME WITH RTTY. VK9N IS PLANNING TRIP TO DACCA FOR A POSSIBLE OPERATION IN DECEMBER.

BRUNEI, V85. V85OO BY N2OO IS EXPECTED NOVEMBER 12 TO 16. BOB PLANS 80 THROUGH 10 METER OPERATIONS, MOSTLY CW. QSL VIA N2OO.

CROZET, FT8W. FT4WB WILL BE RELIEVED AT THE END OF NOVEMBER. FT4WC WILL QSL VIA F6GVH.

EAST MALAYSIA, 9M6. N2OO WILL SIGN 9M6OO NOVEMBER 16 TO 30, INCLUDING THE CQ WW CW CONTEST.   9M6NA IS ALSO A CONTEST EXPEDITION BY JE1JKL. SATY WILL BE QRV NOVEMBER 21 TO 26, WITH EMPHASIS ON LF OUTSIDE THE TEST. 9M8MKS WILL BE ACTIVE NOVEMBER 10 TO 12 FROM THE SEANET CONVENTION.

GLORIOSO, FR/G. FR5ZU/G IS RUMORED FOR DECEMBER. YOU MAY REMEMBER JACQUES FROM TROMELIN, JUAN DE NOVA, OR EUROPA. HE LIKES 14256 KHZ LIST OPERATIONS FROM 0100 UTC.

JUAN FERNANDEZ, CE0Z. CE0ZZZ EXPEDITION IS DUE NOVEMBER 10 TO 18. CW, SSB AND RTTY ON 80 THROUGH 6 METERS PLUS AO13. QSL VIA CE3BFZ.

MARIANA ISLAND, KH0. KH0AM BY JE1CKA WILL BE A SINGLE OPERATOR IN THE CQ WW CW CONTEST. TACK WILL TRY TO WORK 33 KHZ UP FROM THE LOWER BAND EDGES, PLUS 10133, 18073 AND 24903 KHZ OUTSIDE OF THE CONTEST OPERATING TIMES.

MOZAMBIQUE, C9. LLOYD AND IRIS COLVIN MAY EXTEND THEIR C9QL OPERATION UNTIL NOVEMBER 18. QSL VIA YASME.

ROTUMA, 3D2. VK2BCH IS NOW ACTIVE AS 3D2XV. TRY 14222 KHZ AT 0400 UTC.

SAN FELIX, CE0X. XQ0X HAS BEEN REPORTED TO BE THE CALLSIGN FOR A SAN FELIX OPERATION NOVEMBER 15 TO 20. QSL VIA CE3ESS.

VATICAN, HV. HV35SJ WILL BE ACTIVE NOVEMBER 13 TO 18 WITH N6AR AT THE PADDLE. LARRY PLANS MOSTLY CW ON 80 THROUGH 10 METERS. QSL HV3SJ VIA I0DUD.

WEST MALAYSIA, 9M2. 9M2HB WORKS SSB ON 80 THOUGH 10 METERS. TRY 14222 KHZ. ROSS, 9M2AX LIKES CW ON 40, 20 OR 10 METERS AROUND 1200 UTC.

TP5HA. A SPECIAL CALLSIGN CELEBRATING THE MEMBERSHIP OF HUNGARY IN THE COUNCIL OF EUROPE WILL BE USED NOVEMBER 6 TO 18 ON CW AND NOVEMBER 23 TO 25 ON SSB. QSL TP5HA VIA F6FSQ.

YJ0ARW IS ZL1AMO. LOOK AROUND 1200 UTC ON 20 CW AND 2200 UTC ON 10 CW. QSL VIA ZL1AMO.

THIS BULLETIN WOULD NOT BE COMPLETE WITHOUT OUR CONGRATULATIONS TO THE HK0TU MALPELO TEAM, AND THE LCRA, FOR A VERY SUCCESSFUL EXPEDITION. FELICITACIONES Y MUCHISIMAS GRACIAS AMIGAS POR SU TRABAJO ESPLENDIDO.

According to International agreement, all HF users must demonstrate proficiency in morse code. Since all US amateurs can use the HF bands, then all US amateurs knew the code at one time or another. This is the "watering hole" I'm talking about. If you've forgotten where the watering hole is, then I hope you never have to talk to anyone there. i.e. I hope the mic and/or speaker on your HT never flake out when you really need it.

I don't think the rules say "proficiency only when the test is given", but I've never tried to split hairs that closely. I don't think the FCC would yank someone's license if they've forgotten their code element. If that's true, there are a lot of OFs with sexy, short calls in serious trouble.

Perry / KF0CA

((While this subject relates to packet, it is crossposted since))
((the nature of the question could impact non-packet operators.))

There are nationally and internationally recognized frequencies for DX purposes for Morse Code (CW) and voice (usually SSB) modes in the VHF and high bands. For example: 432.100, 1296.100, 2304.100 MHz

I'd like to know if there are any specially designated frequencies, or if anyone would like to have some so designated, for DX-ing on VHF and above in packet modes?

Clearly, use of the frequencies for Morse or voice DX won't go over very well as there will be lots of mutual interference, usually with the CW/SSB modes suffering. Using FM simplex calling frequencies is out. Except for some on 2 meters, there doesn't SEEM to be a national (USA) plan for packet simplex that is actually used in all areas (tell me if you know otherwise).

Should a packet DX frequency be designated from within packet subbands or from DX subbands?

Should there be different frequencies for different baud rates?
1200?
2400?
4800?
9600?
19200?
56000?
1544000?
10000000?

Should packet DX-ers coordinate on another voice frequency first as is a common practice by ATV DX-ers who use 144.340 FM to make contact before trying video? Should it be only on certain bands?

Packet DX could be a very interesting form of operating. Packet DX can make use of many of the short band opening propogation modes that usually go missed by manually operated modes such as Morse and voice. Challenges include how much data one can pass through a band opening before it closes again (maybe within seconds).

Place a cup of water in the oven with the PVC but not touching it.
Some microwave ovens can be damaged by "unloaded" usage, and others
could shutdown the RF when high reflection (no load) occurs.

If the water boils and the PVC doesn't get hot, it should be OK.
If the PVC melts before the water gets hots, don't use that kind.

>He matter-of-factly requested "What's the offset?".

>I just reached down and turned the radio off in disgust.

While travelling to the Dayton Hamfest, I used to check in on the 145.250 wide area repeater in Indianapolis since it was reachable for the bulk of the trip. I wanted to just stay on the same frequency. There were lots of LIDS, too.

I soon discovered that I could use not only 146.52 simplex, but many of the other frequencies near it (146.46 and 146.58 are popular) for talking to fellow hams on the way to Dayton. The return trip is also great for this.

Strange, I was able to keep in contact with them through the WHOLE trip, not just while near Indianapolis. Seems simplex is a WIDE AREA frequency. :-)

> ...is there anyone on the net located in Vermont, Wyoming, or Nevada?

For the right price I can be located in Wyoming. :-)

Seriously... Fort Collins, Colorado is just a 1/2 hour drive south of the border. Someday if'n I'm bored enough when the band is open, I'll drive up there with my 25W HR2510, mobile, and a stack of postcards. Ought to be fun for a change on the receiving end of the pileups.

Nobody actually LIVES in Wyoming, you understand. It's all barren wilderness.

(Now if someone from Wyoming wasn't going to respond before, I think I probably just got their attention. :-)

Good luck --
Alan, N0MFW

Won't work Alan. I tried it. As soon as I crossed the state line the wind started blowing about 70 MPH and the signals on 10 all faded out.

}

AND PJ1B had operators out chasing multipliers who crossed the boundary from simple aggressiveness into outright rudeness in some of the worst pile-up behavior I've seen since 3Y. I'd like to know how many people failed to get into the DX station's log because the instant the DX station came back to them they get stepped on HARD by having PAPAJULIETONEBRAVO shouted over the top of their exchange. The really irritating thing about it is that PJ1B pulled out ahead because of it: looking at the numbers above, they made their big gain in the multiplier count much more so than by the number of Q's (compare percentages). Yeah, I know--you have to fault the DX station for putting up with it. I heard more than a few that wouldn't, but far too many of them were "nice guys" that let it slide.

15 meters is my favorite HF band. (I reserve the right to change my mind about this depending on propagation from month to month :-)).

Why isn't there the equivilent of a 2510 for 15 meters? Or, is there one that I don't know about? Seems to me it wouldn't be that much harder to build than the 10m one, and you could leave off the FM portion and just leave CW, USE, and LSB (packet)

Anybody know anything about NCG attempting this back in the early 80's?

Chris/WZ2B

Kantronics sold one a couple years ago. Evidently business wasn't too great as they gave up on them.

YES!

Once upon a time the call was changed for a move across call areas no matter what you wanted and folks like W2NSD/1 just never "moved" and operated portable for a long, long, time.

If you feel the call you have been assigned is offensive in some way, but are not moving, just fill out a 610 as if you were getting a call change for some other reason, and attach a letter explaining why you believe the call sign is offensive. The rumor I have heard in more that one place, including here, is that the FCC will just go ahead and crank it through the system and you will get another call sign from the assignment sequence for your class and call area.

>It is not clear to me, under the new regulations, if the user of a
>repeater operating above 2 meters can be considered the control operator
>simply due to control on the input frequency. Under the old rules, the

Part of the problem in understanding the rules is that the rules don't
directly designate what kind of station any particular station is. For
instance what do you have to do to make your station into an auxiliary
station? Actually NOTHING. If what you are doing REQUIRES that it be
done via an auxiliary station, then think of your station as an auxiliary
station and FOLLOW THE AUXILIARY RULES (read 97.201(a)-(e)).

>control had to be exerted on a different frequency, which somewhat limited
>that ability of the user to control
>it. I see no prohibition under the new rules to controlling on the
>input frequency, although the requirement to "use an auxiliary
>station" for radio control may require another frequency. It is

Just "BE" an auxiliary station. There is nothing that says the auxiliary
station cannot ALSO be feeding the voice or data input to a repeater in
addition to controlling the station.

>clear to me that an autopatch CANNOT be controlled only via a 2 meter
>frequency - there must be an auxiliary station, and auxiliary stations
>can only operate above 1.25 meters.

For those too shy to read the FCC rules, or for those don't have a copy
(shame shame shame) I will list the auxiliary frequencies:

    220.5 MHz to 225 MHz
    420 MHz to 431 MHz

433 MHz to 435 MHz
438 MHz and all ham bands above

>Anyone know a clear interpretation of this confusing mess (ain't
>"plain english" rules great?)?

They are not "plain english" rules. That was defeated many years ago when the FCC proposed them. They proposed rules somewhat like what you see in Part 95 now.

To me the clear interpretation is to consider what way a station is operating and if that operation is violating any rules?

If I am remotely controlling another station, then my station MUST be an auxiliary station. 97.201(a)-(e) are rules that affect such a station.

Let me tell you about a setup I am currently planning, and why I believe it is legal. I am planning a full duplex autopatch system that is not a repeater and will not be attached to one in any way. The input frequency will be (tentatively, pending coordination) 445.725 MHz. The output frequency will be (tentatively, pending coordination) 145.725 MHz.

1. The base station that is transmitting on VHF will be an ordinary station that will be under remote control and will be passing third party traffic.

2. The "user" station will be remotely controlling the base station and will be doing so as an auxiliary station on a frequency authorized for auxiliary stations.

3. Third party traffic rules (97.115) place restrictions on the station that passes third party traffic, such as requiring the control operator to be at the control point. Other restrictions include limits on who the third party may be. You cannot call up an amateur whose license was revoked or suspended, for instance.

4. 97.213(a), by virtue of defining a radio link between the control point and the station under control, allows the control point to be remote from that station. Thus the "user" of the autopatch will be the control operator, and the location of his station will be the control point. The radio based control link must use an auxiliary link.

5. 97.113(e) specifically prohibits retransmission of signals from a radio station with certain exceptions that include amateur stations. The fact that the base station retransmits on VHF that which it receives from an amateur station on UHF is simply retransmission. This differs from a repeater station which is automatic (see 97.3(a)(34)) since the autopatch will be under remote control of a control operator. It won't have to prevent the input from coming through the output.

This kind of autopatch will quite useful from dual-band radios since these can usually operate in full duplex mode (transmit on UHF while receive on VHF). Hopefully there will be sufficient net loss of audio from the base receiver to transmitter that feedback will not occur, though a headset type usage would be ideal. Not everyone around here (Urbana-Champaign, Illinois) has dual-band capability yet, but I know of a few who do (ka9wgn, kb9ffk, wb9oih, wb9ykv).

If you happen to believe that above setup is not legal, I would suggest you review the rules solidly before suggesting that it is not, because I have gone over them very thoroughly already for this project. I've also gone over the rules a lot for other purposes (filing codefree petition, etc.).

While I am not a communications lawyer or such, that doesn't keep me from reading the rules that apply to my own operation and making my own decisions (which is ultimately my responsibility anyway even if I do consult a lawyer) for myself.

I tend to believe that MOST hams don't read the rules and in fact may not even have a copy to follow. Quite many postings I read in this group indicate a total ignorance of the rules.

25 watts SSB gets you all over the world on 10m, but not so on 15m. Even the 100 watts from my 735 gets stepped on on 15m SSB, particularly when I'm mobile.   This would be my answer: you need more power than a little Uniden unit would provide.

An item on the latest amateur radio Newsline report has sparked my interest.

It mentioned digital audio broadcasting or DAB. This system has been tested

and it seems that according to the tests it is much better than standard

fm. What kind of modulation scheme does it use? How wide a signal is generated?

Any information would be appreciated.

Mere difficulty is not the goal. If someone finds it extremely easy to
pass a test of the basic minimums needed to properly use a radio resource,
then they should be most welcome (unless and until they end up deciding
not to use their knowledge properly).

A more thorough test does not increase in difficulty for someone who really knows and understands the material as it would for someone who is just memorizing a bunch of facts. Making a test long and thorough would, of course, means someone has to work on creating it all. But I see no problem why people should not expect to be taking up to 2 to 3 hours or more to take a test for privileges that can be renewed by mere paperwork for a lifetime.

1. There is a lot of chaff in the current theory test. We only need to test for the wheat.

2. The test should thoroughly and completely test for a full understanding of just the wheat.

ARRL BULLETIN 41 ARLB041
FROM ARRL HEADQUARTERS
NEWINGTON CT NOVEMBER 2, 1990
TO ALL RADIO AMATEURS

THE ARRL HAS FILED ANOTHER REQUEST WITH THE FCC FOR MORE TIME OF COMMENT IN THE MATTER OF PROPOSED CHANGES IN MORSE CODE TESTING FOR

DISABLED PERSONS, PR DOCKET 90-356. IN ITS APPLICATION FOR REVIEW, THE LEAGUE REQUESTED 48 DAYS FOR COMMENT ON THE PROPOSAL, STRESSING THE IMPORTANCE OF THE PROPOSED CHANGES TO THE AMATEUR RADIO SERVICE IN GENERAL AND TO THE VOLUNTEER EXAMINER PROGRAM IN PARTICULAR.

THE APPLICATION FOR REVIEW ASKS IN EFFECT THAT THE COMMISSIONERS OVERTURN AN EARLIER STAFF DECISION NOT TO ALLOW WHAT THE LEAGUE CONSIDERS ADEQUATE TIME FOR COMMENTS TO BE FILED.

ARRL BULLETIN 43 ARLB043
FROM ARRL HEADQUARTERS
NEWINGTON CT NOVEMBER 2, 1990
TO ALL RADIO AMATEURS

DURING THE ANNUAL ARRL SWEEPSTAKES CONTEST WEEKEND, NOVEMBER 3 AND 4, ALL CODE PRACTICE SESSIONS, CW AND VOICE BULLETINS, AND THE KEPLERIAN BULLETIN WILL BE CANCELLED FOR THE CONTEST PERIOD. REGULAR RTTY BULLETINS WILL BE RUN, HOWEVER. W1AW RETURNS TO ITS NORMAL SCHEDULE ON NOVEMBER 5, AT 0000 UTC AS PRINTED ON PAGE 85 OF THE NOVEMBER, 1990, ISSUE OF QST.

ARRL BULLETIN 42 ARLB042
FROM ARRL HEADQUARTERS
NEWINGTON CT NOVEMBER 2, 1990
TO ALL RADIO AMATEURS

THE FCC HAS DENIED THREE PETITIONS, INCLUDING ONE BY THE ARRL, REGARDING POWER INPUT IN AMPLITUDE MODULATION, A3E, RADIOTELEPHONE OPERATION. THE PETITIONS HAD REQUESTED THAT GRANDFATHERING OF THE AM LIMIT OF 1,000 WATTS DC INPUT, WHICH EXPIRED ON JUNE 2, 1990, BE REINSTATED. THE FCC, WHICH RECEIVED MORE THAN 820 COMMENTS, WAS NOT PERSUADED THAT INTEREST IN AM SIGNIFICANTLY EXCEEDS THE COMMISSION'S 1983 ESTIMATE. THE ARRL HAD ARGUED THAT INTEREST IN AM WAS STEADY OR EVEN INCREASING, AND THAT THE NEW RULE WOULD RESULT IN A LOSS OF PRIVILEGES FOR AMATEURS. AS A RESULT OF THIS FCC RULING THE MAXIMUM LEGAL POWER ON AM REMAINS 375 WATTS CARRIER POWER OUTPUT, WITH 100 PER CENT MODULATION.   AT THE SAME TIME, THE FCC ALSO DENIED A PETITION SEEKING TO REMOVE AMPLITUDE MODULATION FROM THE LIST OF LEGAL MODES OF OPERATION.

There is a NOS manual on thumper.bellcore.com:pub/ka9q/docs/userref.nr.
I just looked and saw some other files there too, I don't know about
those. There are other hosts too, some probably have more docs.

And many boaters openly admit that they belong to yacht clubs with resident
"VECs" who pass out licenses without giving tests. (Don't deny it, ARRL
Staffers. I've read their messages concerning it on the SAILING Sig on
Compu$erve.)

~~~~~~~~~~~~~~~~~~

Initial guidelines for the Microwave and RF GROUP Conference.

1) As of present, this conference shall be open ended. As things progress, we'll see how the Conference is developing and then determine if there is a need to fine-tune our scope of discussion.

2) It is possible that this Forum may become an important motivator of the Microwave and RF industry as a whole. Ideas shared in one place strangely seem to find their place in an application later on. Discussions on this forum and the contents of all message traffic promulgated herein are declared Public Domain. Furthermore, this conference is a Public Conference and makes no provision for private messages.

3) The Owners/Operator of RES-Q (TM), hereby declare themselves not responsible in any case of posted information which may be proprietary, confidential or secret. In any such case, liability shall be reverted to the originating BBS's owner/operator and poster. RES-Q (TM) will in no way be responsible for filtering such information but retains the rights to do so.

4) Participants of the Microwave and RF GROUP Conference are solely responsible for what they do with information obtained from the Microwave and RF Conference. RES-Q (TM) makes no warranties express or implied as to our performance as Top Star for this GROUP.

5) Access to the Microwave and RF GROUP Conference is not restricted. A professional, yet congenial, atmosphere is desirable.

6) The Microwave and RF GROUP Conference may not be "ported" outside of GroupMail without prior consent of RES-Q.

7) Finally, let's make this Conference one of the Top 5!

Your Moderator is Bill Kreps

Does anyone on the list recall an antenna from the 1950s called a "T2FD". I
used one successfully but that was years ago and I do not have the specs.
As I recall it came from CQ or QST. It was a wide-spaced folded "dipole"
with a load resistor. THanks for any useful information and esp. for
specs.

Most of the open air coils are just the old
1/2 wave over 1/2 wave antennas. The lower element
usually does need a coil, since the 1/2 wave is
a high impedence feed.

The open coil is just is just a phasing element to get
the radiators in phase so they add, rather then subtract.
A more typical example is the "hairpin" phase method on
a ringo ranger.

The advantage of the open coil is higher power ratings, and
simplicity. (Spell that cheaper!) It is also easier
to make the 800 mhz phasing element this way.

The disadvantage is that the match combinations are somewhat limited.
They also tend to whistle in the wind.

Most people think it must be the best, since it is what cellular
uses. It has the "look".

The higher gain antennas are usually closed coil, and use
a 5/8 wave over 1/2 wave construction. You can get 1-2 db
more gain that way.

The cheapest antennas, and most dual Band antennas are
1/2 wave over 1/4th wave. It has a low impedence feed,
and does not require a coil. it is more sensative to
ground plane then the 1/2 wave variants.

A larsen person told me you just design what ever lower
element you want. The tip is at high impedence, so you
use what ever phasing is neccessary to get the elements to
add + match the feed impedence of the lower antenna.

We also had some interesting discussion regarding 1/2 wave
antennas vs the more common 5/8th wave antennas, and their
gain on *typical mobile installations*.

BTW, you can get a 5/8 over 1/2 wave 2 mtr antenna with 5db
gain. It does not work well bumber mounted, but put it
on a fender or roof, and it works great. It is the
Hustler CG-144. 2+ extra db over a 5/8th wave!

Now if I can just get that field strength range, and mobile
turntable finished in my backyard, I can really do some work! :-)

Actually, you can build the open coil designs easily using copper.
It is harder to do with stainless, but you can test designs very
easily with 12 gauge solid wire.

Try building one sometimes!

Hmmm. I have heard VVV and CQ sent as markers, but "C" sent by itself is a new one. I have also heard a few stations send "DE callsign" by itself as the marker.

> Novice - knows own name

I think this one is in effect already. I just saw a posting in the FidoNet HAM echo from someone who says he just passed the Novice exam and is waiting for his ticket. He wanted to know what bands and frequencies he could use as a Novice! I thought that stuff was on the exam somewhere.

This individual is planning to spend almost four thousand dollars for a top-line HF transceiver. With that kind of money, he should be granted the Extra class license! <half-smiley goes here>

Credit for the following info goes to Bill Goia K2EK from the YCCC
PacketCluster network......

After the dust settled down in PJ-land, here are the scores from PJ1B and PJ9W:

	PJ9W QSOs/Zones/Countries	PJ1B QSOs/Zones/Countries
160	354/14/43	571/19/49
80	1311/22/92	1469/24/99
40	2319/31/130	2166/31/118
20	5440/37/165	5180/38/180
15	5750/38/165	5900/38/180
10	5400/38/155	5819/39/180
	20574/180/750	21105/189/806

The QSO numbers are after-dupes....
The PJ9W 40m country count is expected to drop to 125 (per OH2BAD)

PJ1B had 13 operators
PJ9W had 65 operators

Typical antennas at PJ1B were stacked Cushcraft Skywalker yagis
Typical antennas at PJ9W were: 3el yagi on 75m
stacked full-size yagis on 40m
4x5el collinear stack on 15m

Interesting..........

Any ICOM engineers out there? I need help with figuring out why
one IC-3220A will work crossband repeater mode and another one with very
close serial number will not. An undocumented mod allows crossband repeat
function. With radio on, hold BAND and SET key till flashing L appears
in lower right hand corner of display (must be in dual mode). This allows
receive on 440, with retransmit on 2 meters. My friends radio works, but
mine doesn't. Any ideas why? Does a diode have to be cut? (My friend
says he didnot cut anything other than D4 and D5. This allows extended
frequency range on both bands. This works great.)
My friends' radio will retrans. When I enter this mode, my radio receives
440 signal and keys up 2 meters, but it does not transmit audio. Same on
receive, it receivesthe 2 meter signal and keys up 440, but doesn't
transmit any audio. ????. Thanks.

I have a Uniden HR2510, and I had a technician replace the driver, and final transistors. It now does 10 Watts on AM dead key, and 40 Watts on Side Band (all are RMS readings). I still would like more power. Up here in

Buffalo, 10 Watts AM, nor 40 Watts on sideband is still not enough to talk some skip.

I have heard of people getting 90 Watts out of this radio RMS sideband, but I have no idea on how to do it. Dual finals? Maybe, but I thought I'd ask you if you knew anything about this, or had some hints. Please don't send me mail saying, "Get a Ranger". I don't want to use a linear amplifier because I have had them, and they come over the neighbors cooking utensils, and vast other appliances.

Any help would be appreciated, even a phone number!

```

Please Note: The data in the Solar Terrestrial Forecast and Review is not under copyright. You are free to use these reports any way you like. This also applies to all alerts and/or other reports originating from std_oler@hg.uleth.ca. There was a request regarding the incorporation of parts of these reports in local club newsletters. This is perfectly fine. I would, however, appreciate a receiving a short notice from those who are:

- Using this data in club newsletters,
- Forwarding the reports through packet networks, BBS's or other networks (whether private or public).

I'm interested in keeping track of where these reports are being used and the approximate number of people who might be making use of them. Send all notes regarding the above to: std_oler@hg.uleth.ca.

If any of you actively operate on HF or actively listen to the HF bands, please feel free to send in signal reports as often as possible. Please include a description of the signal characteristics you experienced (ie. stable strong signal, weak fading signal, strong fading and/or flutter, etc.). Make sure you also state the time (preferably in UT) and locations where communication was established (or attempted). Send all signal reports to the same address: std_oler@hg.uleth.ca.

A mailing list has been established for those of you who may be forwarding these reports to other locations or to other networks, or for those who may be incorporating these reports into newsletters, etc. For those of you meeting these requirements, send a request to std_oler@hg.uleth.ca and state which reports and/or alerts you want to receive, as well as the correct address the reports and/or alerts should be e-mailed to. The reports will then be mailed directly to your stated address.

Comments and/or suggestions regarding these reports are always welcomed.

- Cary Oler

--- SOLAR TERRESTRIAL FORECAST AND REVIEW ---

November 03 to November 13, 1990

Report Based In-Part from Data Obtained from the
Space Environment Services Center
Boulder Colorado

SOLAR TERRESTRIAL REVIEW AND SHORT-TERM FORECAST

Solar activity between 28 October and 03 November was Low. Perhaps the most exceptional event of the period was an eruptive prominence which occurred on the northwest solar limb. This prominence produced an x-ray enhancement peaking near a class C1.3 level at 21:58 UT on 02 November.

It was thought that the solar flux had reached it's minimum early last week, but this proved to be inaccurate. It is apparent that this solar cycle is proving difficult to predict (unlike the previous two solar cycles where activity pulses were relatively well predicted).

Geomagnetic activity throughout the week varied from quiet levels to minor storm levels at most latitudes. Middle latitudes experienced an increase in geomagnetic activity on 30 October in response to a well positioned coronal hole. Activity remained at unsettled to active levels until 01 November when activity calmed to predominantly quiet levels. There was basically one minor-storm-level perturbation at middle latitudes, reaching a peak K-index value of 6 between 00 UT and 03 UT on 30 October. This fluctuation occurred over a period of approximately one hour. The variance of this fluctuation was relatively low. High latitudes became unsettled to active on 29 October and experienced several bursts of relatively low-intensity minor storming until near 02 November when activity returned to predominantly unsettled levels.

Propagation throughout this week was mostly normal with very good propagation at mid to low latitudes and mainly fair propagation at high latitudes. The only exception was the period of increased magnetic activity. During this period, high latitudes experienced noticable auroral-induced signal flutter which was - at times - quite strong, particularly during the late evening/early morning hours. Middle latitudes, likewise, experienced occasional periods of fair to poor propagation conditions with increased fading and signal flutter. Low latitudes escaped most of the effects from this activity. Overall signal range during this period was also noticably reduced at many locations (particularly over the higher latitudes).

Auroral activity was not visible at low and many middle latitude locations. Lunar phase reduced the visibility of auroral activity at almost all latitudes. High latitudes were least effected and noticed periods of moderate auroral activity, particularly on 29 and 30 October. Activity subsided thereafter.

The 10.7 cm solar radio flux will begin to rise on 05 November as the more active hemisphere of the sun begins to rotate back into view. This week could prove interesting for solar activity. The active regions which spawned the major flare on 24 October, are due to return this week. Current models suggest that these regions have probably returned back to a relatively stable state, but there is a slight possibility that the instability has been retained. If this proves to be the case, the return of these active regions could herald in an increased risk of major flare activity. However, judging by the characteristics of old flare-producing regions which have been observed in past months, the previously unstable regions have probably stabilized or died and will likely return uneventful. The solar flux is expected to begin increasing this week to a peak value of near 215 to 230 (the model being relied on at the moment suggests a peak value of near 220). M-class flare activity is expected to increase at any time now and should be much more prevalent throughout the coming week.

The geomagnetic field is expected to remain at quiet to unsettled levels until 06 November, when potential effects from a coronal hole should increase magnetic activity to active levels. This increase in activity should peak on 07 or 08 November. There is a risk of minor storming with this impulse of activity at middle latitudes, while high latitudes may experience bursts of major storming. The last rotation of this solar region occurred on 10-12 October when strong minor storming occurred at middle latitudes, while high latitudes experienced major to severe storming. The risk for some repeated strong geomagnetic activity exists with the return of this recurrent region. Current predictions suggest that geomagnetic activity will likely remain confined to active levels with a risk of sporatic minor storming at middle and high latitudes. Conditions should return to quiet to unsettled levels by 09 or 10 November. Should activity surpass levels currently anticipated, a geomagnetic storm alert may be posted. The predicted planetary A-index value for 06 November is 18, which suggests peak planetary K-index values will likely reach 4 and possibly 5 at middle and high latitudes (with higher latitudes sustaining peak K index values of 6 with associated A-index values near 32 to 40). Middle latitude regions will likely observe A-index values between 23 to 30.

Auroral activity will become enhanced near 06 or 07 November, concurrent with the anticpated increase in geomagnetic activity. Activity will likely remain confined to mostly moderate levels at middle and high latitudes. There is, however, uncertainty regarding just how intense the activity may become. There is a risk that auroral activity may reach high levels at high latitudes with an associated moderate southward expansion of the auroral zone. This, however, is currently only speculation. Models currently suggest that activity will remain mostly below magnetic storm levels with only sporatic bursts of minor storming, particularly at high latitudes. The auroral activity therefore, will likely remain at predominantly moderate levels at mid and high latitudes. Low latitudes will likely not be able to witness any of this auroral activity. If this should change, however, an appropriate auroral alert will be posted.

Lunar phase will begin interfering with attempts to view auroral activity in the late evening/early morning hours of 06 through 09 November. However, there should be a fairly good observing window between evening twilight and before the moon rises.

Radio propagation conditions will remain at normal to above normal levels until the impulse of activity from the recurrent solar region begins to impact with the earth near 06-07 November. At that time, propagation conditions are expected to become degraded over almost all latitudes. Middle and high latitudes will be affected most severely, with increased fading and periods of moderate to strong auroral-induced signal flutter. Low latitudes may also experience signal flutter accompanied with decreased signal stability and increased noise. Propagation is expected to be worst on the evenings between near 06 to 08 November. Conditions should then begin a fairly rapid recovery at middle and low latitudes, while high latitudes may take a day or two longer to recover to near normal propagation conditions.

NOTE:

The first M-class flare since 22 October erupted off of the sun at 17:41 UT on 04 November. Region 6350 (S25E25) has grown rapidly over the past 24 hours, from a size of 150 million square kilometers, to a size of 360 million square kilometers. Numerous subflaring has been observed from this region over the past 24 hours. Interaction between this region and Region 6347 (S19E11) probably assisted in producing this flare. The flare itself was rated a class M2.1/1B Tenflare with accompanying rich bursts of radio emissions. The flare was located at S21E15 and lasted 18 minutes. 245 MHz radio measurements indicate that this flare produced an emission of 11,000 s.f.u. (solar flux units) at 245 MHz. Overall sunspot numbers have increased quite substantially over the past 24 hours, from 170 on 03 November to 227 on 04 November. Surging continues to be observed on the northeast and southeast limb, indicating that the active solar longitudes are indeed rotating back into view.

NOTES:
       This graph ONLY depicts geomagnetic conditions observed at Boulder, Colorado for the past 87 hours. Conditions to the north of Boulder will generally have slightly higher activity than Boulder, while conditions to the south of Boulder will likely have lower activity than those depicted here. However, the plots should present a good approximate average of planetary geomagnetic conditions.

       "Anomaly Intensity" is meant to represent nothing more than a very rough guide to the --potential-- interaction geomagnetic fluctuations --might-- have on earth-based systems sensitive to magnetic fluctuations (ie. electrical power distribution networks, telecommunications networks, etc.).

       For radio signal propagation purposes, plot lines are approximately proportional to propagation quality when plot lines are below Minor Storm conditions. Propagation quality may deteriorate rapidly (ie. non-proportionally) when plot lines reach or exceed Minor Storm levels. Complete radio blackout conditions on all short-wave frequencies may occur if plot lines reach or exceed Severe Storm levels.

```

NOTES:

Predicted geomagnetic activity is based heavily on recurrent phenomena. Transient energetic solar events cannot be predicted reliably over periods in excess of several days. Hence, there may be some deviations from the predictions due to the unpredictable transient solar component.

            --------------------------------------------------------
```

NOTES:

Latitudinal boundaries are the same as those given above for radio propagation quality. Periods of high auroral activity may be suitable for auroral-propagation. Locally visible moderate auroral activity will almost always cause moderate to strong deterioration in HF signals, while locally visible high auroral activity will render most HF bands useless.

Auroral activity is defined as follows:

NOT VISIBLE: Not visible

LOW: Diffuse, inactive auroral activity visible very near the northern horizon for mid and low latitudes.

MODERATE: Visibly active, but not exceptionally bright auroral activity most visible above the northern horizon for mid to high latitudes. This type of activity usually encompasses torch-like (or beam-like) aurorae mixed with low-intensity curtain aurorae.

HIGH: Visibly very active, with periods of bright, pulsating curtain aurorae possibly mixed with moderate intensity zenith aurorae. Can occur to the north as well as stretching up near the zenith, particularly at middle latitudes. There may be some color fluctuations

	discernable.
VERY HIGH:	Very active, very bright and very colorful auroral activity possibly mixed with intense zenith and curtain aurorae. Visibly strong pulsations with auroral boundaries to the zenith, stretching even partway to the southern hemisphere of the sky.
EXTREMELY HIGH:	Rare, incredibly bright auroral activity with rapid color and brightness fluctuations mixed with very strong rapid auroral pulsations visible throughout the entire sky.

There are three plotted lines per day in the auroral activity prediction charts. Each of these three plotted lines represent three periods during the evening/morning when auroral activity can be seen. The first line represents the evening twilight period. The middle line represents the --local-- midnight sector, while the last line of each day represents the morning twilight period.

The auroral activity predictions charts are heavily based on recurrent phenomena and may not be accurate in the longer-term due to unforseen and unpredictable transient events (ie. such as solar flares).

The visibility of auroral activity depends on your location and the brightness of the sky (which is dependent upon both city lights and lunar phase). These charts do not account for these variations. The charts are based on dark-sky conditions (lunar phase excluded). Aurorae occur independent of sky brightness, so just because auroral activity may not be directly visible (due to lunar phase, for example) does not mean auroral activity isn't in progress.

Hello Dan,

There is a packet BBS running out of the American Embassy in Saudi Arabia using the callsign 7Z1AB. The BBS is intended for handling mail only traffic for deployed U.S. military personel stationed in the Gulf region.

If you're intentions are to pass traffic through the net, you can E-mail a note to Jim Stone - who set up the link, explaining how much traffic will be passed and work out the logistics.
the E-Mail address for Jim Stone is:

"Jim%taueng.bitnet@mitvma.mit.edu"

Good luck
es 73,
Rich

No.  Your IC-745 as modified is not type-accepted for the CB service.

>I don't ever intend on doing this, but I was just curious.

Usually the "type-accepted" thing is what gets about every radio
modification for some other service besides amateur radio.  It sure
would be nice if we could transmit legally on CB or other services
that we could otherwise transmit on (e.g. if licensed as appropriate)
with the same one radio we have.

It would almost surely have to be type-accepted for all the intended
services, and I don't think the amateur equipment manufacturers are
wanting to do that.  I don't think most hams want to pay the extra
cost.  Besides that, it would be a tempting thing for a CB'er to buy
because of the likelihood of a modification to get full 100 watts (or
whatever) power on 11 meters.  That would end up putting a ham rig in
the hands of a CB'er that would not otherwise buy one (w/o 11 meters).

We know what happens in the ionosphere. We DON'T know what conditions will get set up at any time in the future. It is as hard to predict as the weather.

But, yes, the observation of current propogation conditions is something that people can enjoy, just like the weather.

But do you limit yourself just to HF?

There was controversy on the audible effects of using a slow 44.1 kHz sampling rate. I can actually hear the quantization effects so for me it is no controversy.

Whenever you compress data, you run the risk that some combinations of data will take MORE bits after compression. For audio, there are a LOT of digital stream values that make no particular sense, such as nearly full extremes of values between each sample.

There is a lot of possibility to compress audio, but they do need to be prepared to dynamically expand that bandwidth in some cases where less than optimal compression takes place.

With a bandwidth that dynamically is used in varying amounts, there is extra capacity that could be used on an "as available" basis (and usually there will be some available) non-audio digital service of some kind.

Hello!

I'm looking for a good public domain program for HF Propagation Prediction. Such programs running on Unix and Atari ST would be of most use. I have access to anonymous FTP if required.

I also need a program whose input data can be derived easily - is there a good and regular source of such data on the Internet ?

73 & Thanks in advance,

Mike

[relayed from YCCC PacketCluster (tm)]

Msg #111 From: K2EK Date: 4-Nov 1610Z Subj: CQWW Poop From PJ

After all the dust settled in PJ:

PJ9W				PJ1B		
160	354	43	14	571	49	19
	1311	92	22	1469	99	24
	2319	130	31	2166	118	31
	5440	165	37	5180	180	38
	5750	165	38	5900	180	38
10	5400	155	38	5819	180	39
	20574	750	180	21105	806	189

Both duped. PJ9W 40M country count expected to drop to abt 125 (per OH2BAD).
PJ1B had 13 ops (3 for YCCC) - 65 ops at PJ9W.
Typical PJ1B ant was stacked C-C Skywalker. PJ9W had B I G antennas.
Like 3 el yagi on 75, stacked full size on 40, 4X 5el colinear stack on 15.

No. Citizen's Band (Children's Band) radios must be type accepted
just like Business Band radios. While ham radios probably exceed
the requirements, they are generally not type accepted.

>frequency than the repeater itself].

If the patch is part of the repeater itself, the FCC rules allow it to
be under the same automatic control as the repeater itself.

If the patch is not part of a repeater, and is under remote control, then
the controlling link must be not just on another frequency, but must be
on an AUXILIARY frequency. And you all know what those are.

Congrats to the gentleman on his favorable ruling. I read the opinion
and it looks like the plaintiff presented a masterful case. I was also
under the impression that the city probably should get a new lawyer :-).
He blew some basic legal questions in a big way. I'm not even a lawyer
(although I read a lot of legal stuff, it's interesting) and I
understood a lot of why the hams are winning this one.

PRB-1 seems to be holding up well. Keep up the good fight!

Does anyone have information on where I can obtain a copy of the foreign language phrase book for hams that was written by a Finnish amateur? This book was advertised in QST within the past couple of years. It contains phrases commonly used in QSOs in a number of languages - English, French, German, Finnish, Swedish, etc.

Either new or used is acceptable.

If you take it to the FCC lab and get it type accepted, yes.

This still does not answer my question. Yes, there are great minds that have entered the hobby through a no-code license, but what does that have to do with the goal of an increase in ham participation? This also does not say anything about what percentage of these people would have not joined the hobby if there were not a no-code license.

This still says nothing about the "market survey" I mentioned in my original posting.

I think that most of the proposed DAB (digital audio broadcasting) schemes being proposed envision something like a dozen "stations" sharing a single transmitter. Time-division multiplexing is proposed, and a bit of fancy compression is claimed. I suppose that the substantial number of "stations" puts statistics on your side in the matter of bit rate MOST of the time.

Phil Howard complains about the 44 kHz sampling rate of CDs. Phil, do you ever listen to National Public Radio or ABC radio, etc. They sample at 32 kHz, and compress each 1-millisecond block to 11 or 12 bits. Do you hear artivacts from this?

It's a cinch loop that goes around the trunk of the tree. You push it
up, pull to cinch it (pulling/helping yourself up), cinch with your
legs
around the trunk, push the cinch loop up......It's really a safety
climbing aid - it does entail some physical effort - more than a
climbing
tree stand, but then it doesn't tear up you trees either.

The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial BBS, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space. This week's elements are provided below. The Celestial BBS may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

```

As a service to the satellite user community, the following description of the NASA Prediction Bulletin's two-line orbital element set format is uploaded to sci.space on a monthly basis. The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial BBS, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. The Celestial BBS may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

Data for each satellite consists of three lines in the following format:

```
AAAAAAAAAAA
1 NNNNNU NNNNNAAA NNNNN.NNNNNNNN +.NNNNNNNN +NNNNN-N +NNNNN-N N NNNNN
2 NNNNN NNN.NNNN NNN.NNNN NNNNNNN NNN.NNNN NNN.NNNN NN.NNNNNNNNNNNNN
```

Line 1 is a eleven-character name.

Lines 2 and 3 are the standard Two-Line Orbital Element Set Format identical to that used by NASA and NORAD. The format description is:

Line 2

Column	Description
01-01	Line Number of Element Data
03-07	Satellite Number
10-11	International Designator (Last two digits of launch year)
12-14	International Designator (Launch number of the year)
15-17	International Designator (Piece of launch)
19-20	Epoch Year (Last two digits of year)
21-32	Epoch (Julian Day and fractional portion of the day)
34-43	First Time Derivative of the Mean Motion or Ballistic Coefficient (Depending on ephemeris type)
45-52	Second Time Derivative of Mean Motion (decimal point assumed; blank if N/A)
54-61	BSTAR drag term if GP4 general perturbation theory was used. Otherwise, radiation pressure coefficient. (Decimal point assumed)
63-63	Ephemeris type
65-68	Element number
69-69	Check Sum (Modulo 10) (Letters, blanks, periods = 0; minus sign = 1; plus sign = 2)

Line 3

Column	Description
01-01	Line Number of Element Data
03-07	Satellite Number
09-16	Inclination [Degrees]
18-25	Right Ascension of the Ascending Node [Degrees]
27-33	Eccentricity (decimal point assumed)
35-42	Argument of Perigee [Degrees]

>someone please clarify this terminology for me?
  Open means all users are welcome. Closed means 'members only'
  in the case of a club supported machine and 'me and my friends
  only' in the case of a machine owned by an individual.

  Access to closed repeaters is often limited via the use of
  CTCSS (PL) tones and sometimes other signalling systems.
  Because of this, CTCSS gets confused with the notion of
  a closed machine. Many open repeaters use CTCSS to reduce
  interference.
  >
>As far as I understand it, there are a multitude of "private"

```

```
>all that good?
 Capacity. A dozen repeaters with more local coverage may
 support a dozen short range QSOs while the one wide coverage
 repeater would occupy the frequency in the entire geographical
 area while carrying only 1 QSO. Obviously, the number of
 radio amateurs on the air in a particular geographical area
 comes into play here.

 Many areas of US now recognize the need for a mixture of local
 repeaters and wide area repeaters. Users are encouraged to
 use the local machines unless they really need the range
 of the wide area machine.

A number of DAB systems have been proposed. Generally, they use compression to lower the bit rate from that used on CDs; there will be controversy about the audible effects of this compression.

The DAB systems use various forms of redundant transmission to provide the listener with reception virtually immune to multipath.

Field trials of the European Broadcast Union DAB system yielded CD audio quality in situations that make FM unlistenable.

DAB can be delivered locally with normal towers, or nationally via satellites.

That is _not_ what I said. Please quote me accurately or not at all.
I said that ARRL devotes a relatively small amount to lobbying principally because only a small amount is _needed_. Again, not much legislation has a direct impact on ham radio. Regulation does, so that's where we expend most of our time and efforts.

> One reason given was that there are more effective ways to spend money to

True, if legislation were the most important problem. I think you fail to understand how the Federal government really works. See above.

> Another reason given was that by lobbying we marked ourselves as being not
> nice people. I guess that means we would become somewhat akin to the slimey

> widgets. I know we all joke about Congressmen, but they're not THAT stupid!

Again, not what I said. There _is_ a difference between economic interests and non-economic public interests such as ham radio. It has nothing to do with being "nice," and I never implied it did.

It's a free country, Jim, so go right ahead. I'm betting that working the system's levers from the inside will be more effective than calling your Congessperson and convincing him/her that all hams are nuts.

|>   Ken - WB0QNA

It makes sense for a 1/4 wave magnetic antenna to work like a 1/4 wave
electric one. But 4 meters isn't exactly "1/4 wave"! I don't remember
if theoretic efficiency goes proportional to size or proportional to the
square (which would give you either the claimed 1.5 S units or twice that).
In any case, small antennas have low impedance and consequently high
resistive losses, which are going to make things look worse than theoretical
efficiencies.

Then again, flat dwellers may have no choice. Any antenna is better than
no antenna...

I will be operating N2RM during the CQWW CW section. It appears that we
are going to be successful in putting together the same team (and with others
now wishing to join the fun). I do NOT wish my name or call to be used
against the NOCODE license. It was I who made the motion to the AMSAT

board of directors and Phil Karn who seconded and pushed TAPR via the good offices of Andy Freeborn, then president, to come out publicly FOR a nocode license. This public position by two prominent organizations, in an open letter to the ARRL, was somewhat influential :-) in having them form the Wilson `No-code' committee. I am quite proud of the role we played and I am extremely proud of the work that my friend Phil has done. I'm proud to be his friend.

While I do truly enjoy operating CW, while I will be running one hell of a key at N2RM, and while I operated K2UYH during EME contest exclusively on CW out of necessity (I used DSP to get NARROW!!!! non ringing filters), I would like to say that I do not wish to keep some very good people from helping me on satellites, EME, weak signal VHF work, and more and who see no need for Morse to do this, from having a ham license. I would like everyone who enjoys operating CW, such as myself, to be able to do so. I would also like a class of non Morse using hams to be put together and it appears my wish will soon be granted. Since it appears to me that this is a fait d'accompli, may we now move this discussion on towards how best to bring these people out of the ghetto and into the mainstream?

His analogy not mine. The point is minimum requirements at universities or
whatever produce a well rounded background i.e. exposure to what else is out
there besides ones own myopic view of the world.
In addition, describing the CW requirement as "criminal and immoral" is just
a bit much even for "no-coders".

This magazine was "introduced" at the IEEE-EMC Symposium in Wash. D.C. last
August at the amateur radio luncheon there. I had a chance to speak with
the publisher. The magazine seems legit, but only time will tell how long
it will last (or whether the price will remain "Free"). I gathered from
the questions the publisher asked, that the real reason for the questionaire
was to assess the market for this magazine and to focus the articles
to meet the needs of the potential readership. I also gathered that one of
the underlying reasons for the magazine might be as a technical replacement
for HR magazine. Again, only time will tell. The publisher was also

actively soliciting authors.

I sent in my questionaire, but havn't yet received issue number 2.

Has anyone out there tried, or heard of anyone trying, a J-pole on other than 2 or 6 meters? In particular, I'm thinking about 15 and 20 meters... as a way of avoiding radials.. And I'm thinking of it as an element in a phased array...

What you want is SuperMorse. It runs on a PC, is availiable on Compu$erve. (HAMNET). It will send groups, disk files, keyboard text, simulated QSO's, simulated VEC test with scoring, random groups, random words, allow skill building for head copy and coping behind, etc. You also can modem a couple PC's together. Also it will toggle the DTR pin so you

can run an oscillator and make your own tapes. It also does Farnsworth.

Along with your other good suggestions, I think we need to push the National Park of the Mind concept. Among its other virtues, it is "pre-sold" not only from the standpoint of the of nature of its use but also from the standpoint that it deserves to be preserved despite the more profitable commercial uses the frequencies might have.

"If owls are worth saving, so are hams."

It seems to me (based on my experience) that if a code requirement keeps even ONE otherwise qualified person from becoming a ham, it is a mistake, a disservice to the service. (So far, does that make sense?)

Now you might reverse that and say, "If a code requirement means even ONE life is saved because someone knew the code, it is worth it." But consider: If you don't use it, you lose it. If you don't use the code, you aren't going to know it when you need it. Just like everything else, part of being human.

So it seems clear to me that it's an improper REQUIREMENT. Regardless of how easy it is to learn, regardless of how nice or fun or efficient it is, if it's not something you must know to be a successful ham and to contribute to the hobby, it's an improper requirement.

(Just like having to memorize information you SHOULD look up rather than trust to memory. But that's a different gripe.)

As you try to convert HFers to UHF and SHF, you will certainly hear "but I can't work DX, I can't work my buddies in Texas," or whatever.

Ahh, but you can! This morning before work I called CQ on 435 MHz SSB and an HH2 (that's Haiti) came back to me on 145 MHz. New country for me. OSCAR 13 of course. We had a nice little chat, then I had a longer ragchew with a guy in Tokyo. It's like a 150 kHz wide HF band, only without most of the QRM and lids. The gear is available off-the-shelf, and comparable in cost to good HF stuff. Certainly cheaper than a big tower and tribander, and no TVI or neighbor hassles either.

Yes, the downlink isn't UHF on Mode B, but there's also Mode L which is purely UHF (70cm/23cm).

I'm happy a local I've been encouraging has just gotten on 13 this week. Now he says it's my turn to join him on ATV. Same antenna and amplifier...

Come join us on the bird.

I agree. Unfortunately, I don't have a moral high ground to stand
on, as I have found myself easily sucked into the morass myself.
I am not really anti-nocode, but I find it irresistable to comment
when someone writes "we have already PROVED that Morse is useless",
or "NO ONE uses it anymore." I should just restrain myself.
Everything that I say has been said already.
>

If transmitting out of band is dead, I bet it will be revived again,
especially if the CW/nocode dies out, as it has before.

Nature ABHORS a vacuum!

Different world isn't it, only 600W PEP indeed !
400W PEP is our limit, very much less on 160M.
I wonder how the top (legal) UK score compares with the K1AR score.
Does the 1.5 Kw power input make that much difference ? Or are the big
guns just 20 over 9 instead of 10 over 9 ? I would have thought that
the receiver and location was much more important. Any statistics anyone ?

In response to a thread involving having the ARRL become more active in lobbying Congress, etc., Jon Bloom said that in Newington it was considerated an "inappropriate use of funds" to lobby.

One reason given was that there are more effective ways to spend money to accomplish our goals. I fail to see how you could be more effective in influencing the course of legislation than to spend it WHERE legislation is written and enacted in the education of those BY WHOM the legislation is enacted.

Another reason given was that by lobbying we marked ourselves as being not nice people. I guess that means we would become somewhat akin to the slimey creatures greasing palms under the table to get government contracts to build widgets. I know we all joke about Congressmen, but they're not THAT stupid!

How out of touch can one organization be?

Since the only reasons given for NOT lobbying are so trivial, there is no reason to assume the original reason I gave (HQ is afraid to lose their tax exempt status) is not the real reason after all.

So, since the ARRL won't, we must. There's an election Tuesday. Everyone should call his congressional candidates and give a real pitch for a Joint Resolution of the Senate and the House of Representatives in Congress Assembled declaring ham radio the first U.S. National Park of the Mind and ordering a freeze on diminishing its resources and assets pending further study.

>the shorter the callsign), but callsigns are issued at random.
>
>AL N1AL

They're definitely not issued at random, but rather sequentially from each of four callsign "blocks", depending on the class of license.

I don't have the FCC Rule Book in front of me, but roughly it works like this:

Block A calls are 1x2's beginning with W, K, N; 2x1's beginning with W, K, N; 2x2's beginning with A. To date, most zones have exhausted the 1x2's and 2x1's.

Block B calls are 2x2's beginning with W, K.

Block C calls are 1x3's beginning with W, K, N.

Block D calls are 2x3's beginning with W, K.

KH, KL, and others are reserved for Hawaii, Alaska, etc., as before.

Extra calls come from Block A, Advanced from B, General and Technician from C, Novice from D. If a given block is exhausted, calls are assigned from the next block in order. For example, 6-land Block C's are now exhausted, so new Novices, Technicians, and Generals will all get 2x3 Block D calls.

Corrections/additions to the above are welcome.

/[...] I propose three classes as follows:
>
>Novice - knows own name
>
>General - can print own name
>
>Extra - can write own name in joined-up writing

The tragedy is that the theory tests are actually at about this level.

I guarantee that if any person of average intelligence & memory spends maybe 1 hour/day for a month, they could pass the extra test. There just aren't that many questions. You could do it just by memorisation. Afterwards, you will still know nothing about radio, but you will have all the theory for a licence.

The pro-coders say the code keeps out the 'riff-raff'.
The no-coders say the code keeps out people who would be good hams.

They are probably both right. If we had stiffer theory tests, we wouldn't have to rely on cw as the only barrier keeping the 'unwashed hordes of CBers' off our bands.

I defy anyone to claim that ANY of the theory tests ensure that the new ham will know enough to build or perform significant modification on a transmitter. Yet this is precisely what separates the Amateur service from all other radio services. The reason most hams turn into appliance operators is that they don't know enough to be anything else.

The sooner we stop arguing about the no-code license and start worrying about the current no-theory license, the sooner we will be able to take ham radio into the 21st century.

You might have a point if the average user understood he's the talk of the neighborhood, but most of them don't. I tried to explain that to a new mother of my close acquaintance and she told me that I had to be wrong. After all, "They come in pairs and I have both halves."

>Jersey ?

This is one of those grey areas, but first let me answer the simpler question: Where do hams stand with the law in NJ? - The current law is over 50 years old and does NOT have any exemption for hams. That is why the ham community along with swlers, etc have been pushing for a change.

As to the 2 meter rig in question. It would likely come down to individual interpretation by the police, presuming the cop that might have stopped you (presumably for some other reason than having the radio in the first place) even can determine the ham rig has an extended receive capability beyond that of the ham band.

As to the rig being in violation, according to attorney Frank Taranella (a ham himself) the rig is a technical violation of the existing law, since the extended coverage (138 to 144 Mhz and 144 to 174 Mhz) does have government channels in it. What might happen if one is stopped is, as mentioned already, subject to the whims of the law enforcement community. Once again, the problem as I see it is: Why should we (hams) even hhave to be in a position to worry about this sort of thing in the first place?

All hams, swlers, etc should support the passage of NJ Assembly bill #A-3044 which would lift the current restrictions for everyone.

Jim should post this important decision, since it has been rendered
in a Federal Court and can be used as "precedent" in other cases.
I'll happily wade through the 30K file. Others can skip it at their
pleasure.

> persons will be closer to Saudi Arabia than I am now when I
> send a MARS message.

First off, don't bother looking for someone closer to Saudi Arabia. That isn't how the MARS traffic nets are organized. You would insert the message locally, and they would see to the routing themselves.

Second, the most recent information I have from a local friend in MARS is that there is no service to land based units, but some of the Navy ships DO have service.

There will be those who tell you that ANY address with an APO or FPO number can be handled. That isn't necessarily true. It depends on whether there is MARS service at the delivery end of the path. That is often not the case for a variety of reasons. It also changes from time to time.

Therefore, if you want to try it, send it to me e-mail and I'll check the address. Be certain to include the addressee's full name, rank, SSN, and address as used for mail including APO/FPO. Also, include the sender's full name and address including telephone number.

Don't let this get around :-), but I also used CT in the contest and liked
it a lot.

So when is someone going to write a similar program for the Macintosh?
Or is one of the currently available programs just as good? I haven't
seen any of the contesting programs (such as ZCo's "Six Shooter") myself.

Right. There is a 1-year grace period after your license expires, I believe.

>(I think that I can still remember code but probably not at much better than
>5wpm). I use to be active on 15 and 20 m but would now like to play around

Technician or higher would be fine for VHF packet radio. You'd want at least
a General if you want to also do much HF work. I don't think Kaufman's Q&A
is still around now that commercial licenses are defunct. The ARRL ones are
good. They now have a different book for each license class.

>I don`t
>suppose there is anyway way to get one's old call sign back (WB2CLL), is

>Thanks very much.

You can no longer request a specific callsign for any reason, as I understand
it. You can request a new callsign when you upgrade (the higher the license,
the shorter the callsign), but callsigns are issued at random.

I think this is one big reason so many of us are uneasy about eliminating the code test. As time goes on, the theory tests keep getting easier and easier. At least 13 wpm code will always be 13 wpm code.

Amen! The ARRL currently goes through a lot of gyrations and expense to administer the Code Proficiency, WAS, DXCC, and other awards with questionable public benefit. What if the ARRL provided proficiency awards in technical knowledge? Just as Joe Ham could get a certificate for copying code at 40wpm (an admirable goal, don't get me wrong!) he could also get a nice piece of wallpaper for studying the fundamentals of TCP/IP or Microwave Communication, or other subjects. If it was all accredited by some suitable acrediting board, Joe Ham could even get college credit and financial aid! NARTE (National Association of Radio and Television Engineers) already provides some form of cross-accredidation for holders of Amateur Advanced and Extra licenses, think of what could be done with this proposed self-betterment program!

Maybe then the ARRL could put some substance behind its espousing of ham radio as a "trained bank of electronics experts" that it keeps handing out to the FCC, the Congress, and the ARRL Membership.

(Yes, I'm a a member, and I make my opinions VERY clear to my SM and my Division Director.)

SB SPACE @ ALLBBS < KD2BD $SPC1105
* SpaceNews 05-Nov-90 *

Bulletin ID: $SPC1105

SpaceNews

MONDAY NOVEMBER 5, 1990

SpaceNews originates at KD2BD in Wall Township, New Jersey, United States. It is published every week and is made available for unlimited distribution.

* PIONEER 11 STATUS *

The Pioneer 11 spacecraft emergency support continues with 70 meter antennas in high power transmitter uplink configuration. Non-coherent downlink telemetry has been processed by the Ames Research Center. Following the uplink with the 70 meter antenna in Spain on 28-Oct-90, the 70 meter antenna in Goldstone was unable to acquire 3 way downlink. The project at Ames reports commands are getting into the Pioneer 11 spacecraft, but the planned receiver swap was not successful.

[Information via JPL]

* MAIL BAG *

I've been receiving quite a few questions recently about DOVE-1/OSCAR-17. First of all, DOVE transmits on a frequency of 145.825 MHz FM. This downlink carries spacecraft telemetry (AX.25 AFSK packet radio format) as well as synthesized voice transmissions. To date only telemetry has been carried on DOVE's downlink as spacecraft testing continues.
After new software has been loaded and tested on DOVE, the Votrax speech messages should be heard. It should also be mentioned that DOVE-1 does

not have mailbox capabilities. It was designed primarily for downlinking digitized voice messages to Earth.

Q: Could you carry Keplerian orbital data in SpaceNews?
A: Since there are other outlets for Keplerian orbital data, I would rather not repeat that information here. (Sorry!)

Q: Are they any satellites that I can access with an HT?
A: Well, you could get a signal into RS10 or RS11 on Mode A with nothing more than a handheld 2-meter transceiver if you were to key the PTT button with CW, but this usually results in a very chirpy signal! FM and other "constant carrier" emissions should be avoided when communicating through amateur satellite transponders.

Q: Is "SpaceNews" associated with the trade journal "Space News"?
A: No. "SpaceNews" has been in existance since November 1987. It is dedicated to topics of interest to Amateur Radio operators worldwide and is non-profit publication without connection to any organization, public or private.

* OSCAR-13 NEWS *

Command Stations performed magnetorquing procedures near perigee of orbits on October 15-17. The new transponder schedule is as follows:

Mode-B : MA 000 to 095
Mode-JL: MA 095 to 125
Mode-LS: MA 125 to 130
Mode-S : MA 130 to 135
Mode-BS: MA 135 to 140
Mode-B : MA 140 to 256
Omnis : MA 220 to 040

This schedule is expected to continue throu 26-Dec-90. The spacecraft attitude is BLON = 180 and BLAT = 0.

>not with competition from computers, video games, etc. (none of which
>require a license of any kind).

And this is the whole point of all this endless debate.
There are some of us who agree.  CW is not cutting edge.  And if moving
toward the cutting edge of technology is what it is going to take, then
we better get moving cause we are so far back now, you can't even see it
from here.

It's true that ham radio is not the cutting-edge hobby it once was. And that's due in large measure to hams clinging to obsolete techniques, which is not in itself totally harmful, but, when it is embedded in the entrance requirements, is deadly to attracting people who prefer not to renact the past, but instead to invent the future.

If you believe that an amateur license exam where Morse makes up less than 50% of the score will inevitably result in glorified CBers and ham XYLs overrunning the microwave bands, then there is no hope for amateur radio. I believe that, with the obstacle of an exam which has fully 50% devoted to an arcane historical manual modulation encoding removed, an aggressive recruitment campaign can succeed in attracting bright young people once again to the cutting edge of communications, a revitalized amateur radio.

If we only get an additonal 5% growth, and only a few percent of those are the sort of activists who have caused the explosion in computers, then we will increase the ranks to the doers and dreamers in ham radio a hundred fold. Some will joyfully accept the advances in digital communication and extend them manyfold. Some will delight in satellite communication and join the now thin ranks as supporters and builders of future systems. Some may be challenged to build cellular repeater systems. Others may wish to explore picture transmission. A few may even learn CW and desert to the DC bands to become DXers. Oh well, you can't win them all. :-)

>>

This is the traditional generation gap you are experiencing. Every older
generation truely believes that the young people are going to hell and
that civilization is on the brink of collapse. In my generation it was
beatniks, Elvis, and that devil music rock and roll. Later it was protest,
hippies, and Jimi Hendrix. Today it's punk and rap. Yet during all that time
we won and lost wars, revolutionized electronics, sent men to the moon, and
invented teflon frying pans. Relax, be happy mon! The Dow is at 2400 vs 700
ten years ago, our national debt of three trillion dollars is a smaller
percentage of our GNP than at any time since World War II, at the peak of the
S&L crisis more new banks were formed than failed. Somehow civilization
survives the culture shock of new ideas and new ways and carries on. As Darwin
```

said, "Adapt or die!". Or as a younger thinker said, "Go with the flow.".

>Below 30 Mhz, if the Amateur Radio Service does not reverse the decent into
>in your face street behavior, commercial interests will have all the ammunition
>they need to justify seizing all of the ham spectrum as being too valuable
>to waste on a bunch of radio hoodlums.

We just gained two new bands at HF as I recall. The commercial interests are abandoning the "worthless" HF spectrum for satellite links, fiber optic links, and microwave links as quickly as possible. Soon no one will want HF but the few remaining retired hams and a few die hard propaganda broadcasters. The future of communications is upstairs in the microwave spectrum. We can lose our share of this spectrum, our future, if we continue to put archaic obstacles in the way of those young turks who can develop it.

It won't be easy reversing the image of ham radio as a cliquish bunch of weird old men playing with radios. But, with the removal of an archaic obstacle to entry, there is a chance that it can be done. With a lot of hard work and some smart promotion, the old girl may come back to life yet.

Well it is how the DXers do it already. Send those green stamps. DXCC at any price. I understand that some enterprising VECs will sell you an Extra class license for $100 today. Then you can get on your CW computer and impress the low caste Novices at 50wpm and 2kw just like a real Extra. Phooey! Just stay on the DC bands and don't bother those of us Upstairs where the future of communications is happening.

Definitely. But how about putting a big fence around ALL the parks and refuse to allow anyone in who cannot prove by a test that they can ride horseback. There are good reasons for learning this skill, too. What if you car breaks down in an emergency? Horseback riding is also a very worthwhile and enjoyable skill. It is the traditional mode of transportation. And besides, if we don't force the coming generations to learn how to ride a horse, that would be the same as denying them the opportunity.

BTW I never learned how to ride a horse faster than a trot, but that's good enough to get into some of the more remote parks that no one ever goes to that are being threatened by commercial interests.

:-)

The difference between 400 W and 1500 W is less than 6 dB, less than one S-unit. If it weren't for the fact the so many stations in this part of the world run 1500 W, I expect the contest scores would be just as high with 400 W. After all, the vast, vast majority of the stations worked by the winners are running low power and, as the old saying goes, "You can't work 'em if you can't hear 'em." In addition, especially in the SSB contest, the bands are so crowded that only the loudest stations can stake out a frequency successfully. The stations with the big scores have to spend most of their time calling CQ and running other stations, since it's the only way to keep up the kind of rate necessary to compete.

DX BULLETIN 44 ARLD044
FROM ARRL HEADQUARTERS
NEWINGTON CT NOVEMBER 2, 1990
TO ALL RADIO AMATEURS

THANKS TO ALLEN, N2KW AND THE TRISTATE DX PACKETCLUSTER NETWORK FOR

THE FOLLOWING DX INFORMATION.

ANGOLA, D2. RUMORS PERSIST OF A WEEK OF OPERATION ON SSB, CW AND RTTY FROM LUNDA BY A WELL KNOWN EUROPEAN DXER.

ALBANIA, ZA. IN A REVERSAL OF WHAT WAS WIDELY EXPECTED, A TRIO OF ALBANIAN OFFICIALS VISITED BUDAPEST RECENTLY, FOR A DEMONSTRATION OF AMATEUR RADIO.

BAHAMAS, C6. C6AFQ BY K1TN AND KR1S WILL ENTER THE CQWW CW CONTEST, WITH OPERATION ON THE NEW BANDS OUTSIDE THE CONTEST NOVEMBER 21 TO 27. QSL C6AFQ TO K1TN AND C6A/KR1S TO KR1S.

BANABA, T33. KIYOKO, ZK3KY, WILL BE JOINING THE BANABA TEAM DURING THE T33R OPERATIONS SCHEDULED FOR NOVEMBER 6 TO 20. WATCH FOR T33R ON 1823, 3785, 7085, 14145, 14185, 21285 AND 28485 KHZ SSB. THE CW STATION T33T, WILL BE ON 1832, 3505/3523, 7003/7023, 14023, 21023 AND 28023 KHZ. 12, 17 AND 30 METER ACTIVITY DURING THE SECOND WEEK OF OPERATION. QSL VIA OH3GZ.

BRUNEI, V85. LOOK FOR V85OO BY N2OO NOVEMBER 12 TO 16. OPERATION WILL BE ON 80 THROUGH 10 METERS AND WILL BE MOSTLY CW.

EASTERN MALAYSIA, 9M8. 9M8MKS WILL BE ACTIVE NOVEMBER 10 TO 12 FROM THE SEANET CONVENTION. THE CLUB STATION IS LOCATED AT THE HOLIDAY INN KUCHING, SARAWAK. QSL VIA 9M2FH.

JUAN FERNANDEZ, CE0. WATCH FOR CE0ZZZ NOVEMBER 10 TO 18. CW, SSB AND RTTY ON 80 THROUTH 6 METERS PLUS AO13. QSL VIA CE3BFZ. CE0ZCD HAS BEEN WORKED ON 14195 KHZ AT 0100 UTC AND 28510 KHZ AT 1300 UTC. ALTHOUGH LOCATED ON JUAN FERNANDEZ, SERGIO QSLS VIA BOX 1972, VALPARAISO. CE0ZIG IS LOCATED ON EASTER ISLAND.

MALPELO, HK0. HK0TU IS DUE TO OPEN TODAY FOR A 5 DAY OPERATION. FREQUENCIES WILL BE 1825, 3505, 7005, 14025, 21025 AND 28025 KHZ FOR CW. FOR SSB, LOOK ON 1835, 3795, 7085, 14145, 21195 AND 28395 KHZ. QSL VIA HK3DDD.

MINAMI TORISHIMA, JD1. JH1MAO/JD1 HAS BEEN ACTIVE THIS WEEK. QSL VIA JA1GUC. JR1VTDT/JD1 HAS ANNOUNCED A 2 WEEK OPERATION FROM MARCUS ISLAND AS WELL. IT IS NOT KNOWN IF THESE TWO ARE TRAVELING TOGETHER OR NOT.

MONGOLIA, JT1. JT1CO MEETS KA2BBZ ON THURSDAY AT 0000 UTC ON 21285 KHZ. BILL WILL ATTEMPT TO ARRANGE A 10 METER SCHEDULE FOR THE DIFFICULT PATH TO THE EAST COAST OF THE USA.

MOZAMBIQUE, C9. ONLY A FEW DAYS REMAIN TO WORK C9QL. IRIS WAS ON 40 METER CW MONDAY, ADDING ANOTHER BAND TO THIS MOST WELCOME STOP IN THE YASME ITINERARY.

ROTUMA, 3D2. FAMILIARIZE YOURSELF WITH THE OPERATING HABITS OF A35XV. IN ANOTHER WEEK, OR SO, BING WILL BE SIGNING 3D2XV FROM

ROTUMA.

TONGA, A35. A35XV, BY VK2BCH, HAS BEEN ACTIVE ON 40 THROUGH 10 METER SSB. BING IS SCHEDULED TO MOVE ON TO ROTUMA IN A WEEK OR SO. TRY 14222 KHZ AT 0400 UTC.

SAUDI ARABIA, HZ. 7Z1AB IS THE NEW CLUB STATION AT THE AMERICAN EMBASSY COMPOUND IN RIYADH. RICK IS TRYING TO BUILD THE STATION UP IN BETWEEN HIS 18 HOUR WORKDAYS. HE TRIES TO GET ON THE AIR BETWEEN 1700 TO 2000 UTC, EITHER 15 METER SSB OR ON VARIOUS 20 METER NETS. OPERATORS DON, DAN AND DIRK HAVE EVEN LESS TIME AVAILABLE TO OPERATE. DON LIKES CW. THERE IS A PLAN AFOOT TO PUT THE IC 765 ON RTTY IN THE NEAR FUTURE.

SUDAN, ST2. WZ26C/ST4 IS QRT. ERIC HAS COMPLETED HIS PROJECT IN THE SUDAN. HE IS CURRENTLY IN KENYA, AWAITING TRAVEL ARRANGEMENTS TO ENGLAND. HE ASKED US TO PASS ALONG HIS THANKS FOR THE OUTSTANDING COOPERATION OF ALL RADIO AMATEURS AND THEIR UNDERSTANDING HIS OPERATING RESTRICTIONS. QSL VIA W4FRU.

TURKEY, TA. TA0W IS LA6WAE WHO SAYS TO QSL VIA LA5NM.

WEST KIRIBATI, T30. TARAWA IS THE SITE OF AN IMPROMPTU DX CONVENTION. T30JH BY VK2GJH IS STILL ACTIVE. WITH JG2BRI, OH1RY, SM7PKK, TF3CW, AND ZK3KY ALL IN TOWN, STAGING FOR THEIR BANABA ADVENTURE, IT SHOULD BE EASIER TO CATCH T30, THIS WEEKEND, THAN ANY TIME IN RECENT MEMORY.

PROPAGATION FORECAST BULLETIN 44 ARLP044
FROM ED TILTON, W1HDQ
SPRING HILL FL OCTOBER 29, 1990
TO ALL RADIO AMATEURS

EARLY IN THE SECOND HALF OF OCTOBER THE SOLAR FLUX DROPPED RAPIDLY. IT HAD PEAKED AT 232 ON THE 15TH, THE HIGHEST FLUX READING SINCE LATE IN AUGUST, BUT BY THE 20TH IT WAS DOWN TO THE 150S. A LOW OF 152 CAME ON THE 28TH.

A CLEAR SKY ON THE 29TH SHOWED NEW SPOT ACTIVITY ON THE SUN NEAR THE EAST LIMB, AND THE SOLAR FLUX BEGAN TO RISE. DISTRIBUTION OF ACTIVITY ON THE SUN IS SUCH THAT HIGHER FLUX NUMBERS MAY CONTINUE FOR SEVERAL DAYS. NONE OF THE SPOTS PRESENTLY VISIBLE WILL BE LOST TO SOLAR ROTATION FOR SEVERAL DAYS, SO THE FORECAST WEEK MAY PROVIDE HIGHER USABLE FREQUENCIES INTO EARLY NOVEMBER.

WHATEVER THE SUN DOES, NOVEMBER OFTEN PROVIDES HIGH USABLE FREQUENCIES AND GENERALLY GOOD PROPAGATIOC BOTH PEAKING LATE IN THE MONTH. WITH INTEREST IN 50 MHZ DX NOW WORLDWIDE, THIS COULD BE ONE OF THE MOST INTERESTING MONTHS FOR VHF DX ON RECORD. TEN METERS AND THE MEW BANDS WILL ALSO BE AT THEIR BEST.

AMERICAN SUNSPOT NUMBERS FOR OCTOBER 18 THROUGH 24 WERE 166, 142, 129, 143, 132, 133 AND 126 REEPECTIVELY, WITH A MEAN FIGURE OF 138.7. SOLAR FLUX NUMBERS AS REPORTED BY WWV FOR THE SAME TIME PERIOD WERE 195, 221, 200, 187, 169, 164 AND 157, WITH A MEAN FIGURE OF 184.7.

Well, actually, you do speak at 9600 bps, or somewheres thereabouts. SSB is suprisingly close to the Shannon bound, with ACSB being even closer. Somehow, CW always seemed too slow for me. And, given the symbol time and channel fading, it lacks the redundancy of voice. But, I've made these points before...

> Where is the skill in talking into a microphone?? We all know that
> CW is more of a skill than any voice mode or the code bashers wouldn't
> be whining so much about it. :-)

Wrong end. As with any communication system, the hard part is the receiver. A well trained, experienced weak signal sideband op can pull all kinds of signals out of the ether that your average human wouldn't. That's because the human auditory system is optimized for speech.

UNITED STATES DISTRICT COURT

NORTHERN DISTRICT OF OHIO

EASTERN DIVISION

JAMES D. MacMILLAN,) 1:87,CV 2820
)
Plaintiff,)
)
- vs -) ORDER
)
CITY OF ROCKY RIVER, et al.,)
)
Defendants.)

Battisti, J.

Before the court is Defendants' Motion to Dismiss and/or for Summary Judgment. Also before the court is Plaintiff's Motion for Partial Summary Judgment on Counts I and III of his Complaint.

Plaintiff James D. MacMillan ("MacMillan"), an amateur radio operator, licensed by the Federal Communication Commission, brings this action against the City of Rocky River, the Building Commissioner for the City of Rocky River ("Commissioner"), in his individual and official capacities, and the members of the Board or Zoning and Building Appeals of the City of Rocky River ("Board"), individually and in their official capacities, for denying, pursuant to certain City ordinances, his application to construct a thirty foot radio antenna system at his Rocky River residence. MacMillan seeks a declaratory judgment, injunctive relief and damages, based upon alleged violations of his rights under the United

States Constitution and relevant federal statutory law (1)

Jurisdiction in the federal district court is predicated upon these alleged violations of the United States Constitution and federal statutory law. 28 U.S.C. (sect.)(sect.) 1331, 1337 and 1343 (1982).

I. FACTS

On or about January 20, 1987, Plaintiff applied to the City of Rocky River for a building permit to construct a thirty (30) foot antenna system at his residence on Gibson Drive in Rocky River. On June 5, 1987, the Commissioner notified the Plaintiff in writing that his application for a building permit was denied based upon three grounds. First, the Plaintiff's proposed radio tower would exceed the maximum height allowance under section 1143.10(b) of the Codified Ordinances of the City of Rocky River. Section 1143.10(b) states in relevant part that:

> "broadcasting towers, radio... antennae... may be erected above the height limit for the district, subject to the following constraints:
>
> > (1) The height from the base of such structure, or the uppermost point at which such structure is attached to a building, to the top of such structure shall not be greater than the horizontal distance from the base of the structure to the nearest adjoining property

---

(1) Specifically, as an amateur radio operator, Plaintiff claims violations of his rights under the Communications Act of 1934, 47 U.S.C. (sect.) 151, et seq., and the rules and regulations of the Federal Communications Commission ("FCC") promulgated thereunder, 47 C.F.R. , Part 97.

> line.
>
> Codified Ordinances of the City of Rocky River (sect.) 1143.10 (Ord. 59-73, Passed July 23, 1973) (1985).

In addition, the Commissioner stated that Plaintiff failed to provide certain technical information necessary to reviewing the permit application. Finally, the Commissioner stated that the proposed radio tower was not necessary for the development of Plaintiff's property and would result in a substantial impairment of neighboring real estate values, thus justifying denial of the permit pursuant to section 1333.02 of the Codified Ordinance of the City of Rocky River. Section 1333.02 states that:

> Whenever application is made for a permit to construct or alter a building or structure within this City, and the Building Commissioner finds that the proposed building or structure is of such value, design, material or location that it will result in a substantial impairment or destruction of value in neighboring real estate, and if he further finds that the use of the particular design, material or location proposed, or substantially similar ones, is not reasonably essential to the development of the property proposed to be built or altered, the Building Commissioner shall refuse to issue the permit. He shall within five days notify the applicant of such refusal and the reason thereof.
>
> Codified Ordinances of the City of Rocky River (sect.)1333.02 (Ord. 3077, passed November 14, 1955) (1985).

Plaintiff appealed this determination to the Board. On or about August 13, 1987, the Board approved the

Commissioner's decision to refuse Plaintiff's application for a building permit.

On or about August 27, 1987 Plaintiff appealed the Board's decision to the Cuyahoga County Court of Common Pleas, pursuant to Ohio Rev. Code Ann. (sect.) 2506.01 (Anderson 1981 & Supp. 1989).(2) See James D. Macmillan, et al. v. the City of Rocky River, Ohio, et al. , Case No. 135089. On or about October 6, 1987, Plaintiff filed a Motion for Enlargement of Time with the Cuyahoga County Court of Common Pleas, requesting an extension until October 27, 1987, to file a Brief in Support of his Appeal. On or about October 27, 1987, Plaintiff filed a Motion to Stay Proceedings in that Appeal. On November 9, 1987, Defendants filed a Brief in Opposition to Plaintiff's Motion to Stay Proceedings in the Court of Common Pleas. Apparently, Plaintiff has, to date, filed no brief in support of his appeal in the court of common pleas.

On October 27, 1987, the same day Plaintiff filed his motion to stay proceedings in the court of common pleas, Plaintiff also filed the complaint in the instant case in federal court.

The complaint alleges six claims against the City, the Commissioner and the Board:

---

(2) (sect.) 2506.01 states that:

> Every... decision of any... board... or any political subdivision of the state may be reviewed by the common pleas court of the county in which the principal office of the political subdivision is located...

Count I --- Sections 1331.01, 1333.02, and 1143.11(b) of the City Ordinances contravene federal law on their face and as applied to Plaintiff, thereby violating Art. VI (sect.) 2 of the United States Constitution.

Count II --- Sections 1331.01, 1333.02, and 1143.11(b) are unconstitutional on their face and as applied, in that they unreasonably burden radio communications and interstate commerce, thereby violating Art. I (sect.) 8.

Count III --- sections 1331.01, 1333.02, and 1143.11(b) are impermissibly vague and overbroad, thereby violating the First and Fourteenth Amendments. In addition, Defendants failure to promulgate reasonable rules relating to the grant of permits deprives Plaintiff of equal protection and due process, in violation of the Fourteenth Amendment.

Count IV --- Sections 1331.01, 1333.02, and 1143.11(b) are void and unconstitutional on their face and as applied insofar as they constitute an invalid exercise of state police power.

Count V --- sections 1331.01, 1333.02, and 1143.11(b) are void and unconstitutional on their face and as applied in that they deprive Plaintiff of equal protection in the exercise of his constitutional rights, guaranteed by the Fourteenth Amendment.

Count VI --- Defendant commissioner and Board members conspired to and did, under color of State law, deny plaintiff his constitutional right to a fair hearing and of his rights

and privileges under the First and Fourteenth Amendments and by statute.

Plaintiff seeks declaratory and injunctive relief, as well as damages. The suit names as defendants the City of Rocky River, the Commissioner in his official and individual capacity, and the Board members in their official and individual capacities.

Defendants argue that the court should invoke the doctrine of abstention and decline to exercise jurisdiction. Alternatively, Defendants argue that Plaintiff's complaint should be dismissed in its entirety for failure to state a claim upon which relief can be granted, and/ or Defendants should be awarded summary judgement as a matter of law. Defendants also argue that the Commissioner and the Board members are protected from civil liability by qualified immunity, and therefore, the complaint against them in their individual capacity should be dismissed. Finally, Defendants argue that the Board members are not proper parties to the lawsuit, and thus, the court should dismiss all claims alleged against the members of the Board in their official capacity.

Plaintiff has moved for partial summary judgement on counts I and III.

II. ABSTENTION

The court finds no reason to abstain in the instant case. Noting that "[a]bstention from the exercise of federal

jurisdiction is the exception, not the rule," Colorado River Water Conservation Dist. v. United States, 424 U.S. 800, 813 (1976) and that absent "exceptional circumstances," County of Alleqheny v. Frank Mashuda Co. , 360 U.S. 185, 189 (1959), federal courts have "the virtually unflagging obligation.. . to exercise the jurisdiction given them, " Colorado River, 424 U.S. at 817, the Supreme Court has confined the circumstances appropriate for abstention to three general categories: (1) those that present "a federal constitutional issue which might be mooted or presented in a different posture by a state court determination of pertinent state law" ("Pullman" abstention) ; (2) those that present "difficult questions of state law bearing on policy problems of substantial public import whose importance transcends the result in the case then at bar" ("Burford" abstention) ; and, (3) those in which "absent bad faith, harassment, or patently invalid state statute, federal jurisdiction has been invoked for the purpose of restraining state criminal proceedings" ("Younqer" abstention). Colorado River, 424 U.S. at 815-816.

Defendants' brief argues that this court should abstain from ruling on Plaintiff's constitutional allegations under the Pullman line of cases. This argument, however, demonstrates a misunderstanding of the nature of that doctrine. Defendants claim that this court should withhold judgement until the Ohio courts have an opportunity to rule on the preemptive effect of the Federal Communications Commission's Memorandum Opinion and Order In the Matter of Federal Preemption of State and Local Regulations Pertaining to Amateur Radio Facilities, 50 Fed. Reg. 38813 (adopted September 16, 1985) (hereinafter referred to as "PRB-l").

While the preemptive effect of PRB-l will be discussed herein, it is enough to note at this time that preemption is not an unresolved question of state law of the type envisioned in the Pullman line of cases. Preemptive effect is, instead, a question of federal law, and thus, not a proper ground for Pullman abstention.

In addition, a federal court should only abstain under the Pullman doctrine where the state statute in question is uncertain. Babbitt v. United Farm Workers National Union, 442 U.S. 289, 306 (1979). In this instance, defendant has failed to indicate any way in which the relevant ordinances could be interpreted by Ohio state courts to avoid the constitutional questions raised in this action.

Burford abstention is also inappropriate in this case, as the state interest in local land use policy is insufficient to overcome the strong federal interest in promoting amateur radio operations. The Supreme Court stated in the Colorado river case that "the presence of a federal basis for jurisdiction may raise the level of justification needed for abstention." 424 U.S. at 815 n.2l. In issuing PRB-l, the FCC created "a limited preemption of state and local regulations which preclude amateur communications." 50 F.Reg. 38813. PRB-l states that:

> The ruling is necessary so that amateurs and local governing bodies alike will be aware of the strong federal interest in promoting amateur communication. The effect of the ruling is to give local communities and amateur operators a clear statement of the federal interest in amateur communications.
>
> Id. (emphasis added).

In addition, the ruling states that local ordinances "must be crafted to accommodate reasonably amateur communications" and to "represent the minimum practicable regulation to accomplish the local authority's legitimate purpose. " Id. at 38816. In light of this clear federal interest and the presence of at least partial preemption of local ordinances, it would be inappropriate for this court to abstain.

Several other federal courts have refused to abstain in cases similar to the one at hand. In Izzo v. Borough of River Edge, 843 F.2d 765 (3rd Cir. 1988), the plaintiff, an amateur radio operator licensed by the FCC, applied to the borough planning board for a variance to construct a forty foot transmission tower at his residence. After a hearing, the board denied the variance, and the applicant filed a complaint in district court alleging constitutional violations and an invalid exercise of the borough's police power. The court stated that while " [f]ederal courts have expressly disavowed any desire to sit as a statewide board of zoning appeals hearing challenges to actions of municipalities.. ., [t]he special circumstances here require that the district

court retain jurisdiction and adjudicate its dispute." Id. at 769. Among those "special circumstances" was that "an express, narrow, and quite specific federal provision threatens, at most, only a minimal disruption of a broad state policy." Id. See also Bodony v. Incorporated Village of Sands Point, 681 F.Supp. 1009, 1014 (E.D.N.Y. 1987) (finding abstention in such cases "inappropriate").

Accordingly, abstention is not warranted in the instant case.

III. STANDARD OF REVIEW

Defendants argue that this action should be dismissed pursuant to Fed. R. Civ. Proc. 12(b) (6) for failure to state a claim upon which relief can be granted or alternatively that summary judgment should be granted. The court will treat Defendant's motion as one for summary judgment, as matters outside the pleadings are presented to and not excluded by the court. Fed. R. Civ. P. 12 (b). The granting of summary judgment is proper "if the pleadings, depositions, answers to interrogatories, and admissions on file, together with the affidavits, if any, show that there is no genuine issue as to any material fact and that the moving party is entitled to a judgment as a matter of law." Fed. R. Civ. P. 56(c) ; see Celotex Corp. v. Catrett, 477 U.S. 317 (1986). In considering the propriety of a motion for summary judgment, the court must view all facts and inferences in a light most favorable to the

nonmoving party. Securities and Exchange Commission v. Blavin, 760 F.2d 706, 710 (6th Cir. 1985).

"The moving party has the burden of showing the absence of genuine disputes over facts which, under the substantive law governing the issue, might affect the outcome of the action." Harris v. Adams, 873 F.2d 929, 931 (6th Cir. 1989) (citing Anderson v. Liberty Lobby, Inc. ., 477 U.S. 242 (1986)). The nonmoving party, on the other hand, "is required to present some significant probative evidence which makes it necessary to resolve the parties' differing versions of the dispute at trial." 60 Ivy Street Corp. v. Alexander, 822 F.2d 1432, 1435 (6th Cir. 1987) (citing First Nat'l Bank of Arizona v. Cities Serv. Co., 391 U.S. 253, 288-89 (1968)). The nonmoving party must go beyond the pleadings "and by her own affidavits, or by the depositions, answers to interrogatories, and admissions on file, ' designate specific fact showing that there is a genuine issue for trial." Celotex Corp. , 477 U.S. at 324.

III. PRECLUSION

Plaintiff seeks summary judgement in this case on the ground that the local ordinances in question, both as written and applied, are preempted by PRB-l, and thus, may not be enforced without violating the Supremacy Clause of Article IV, section 2 of the United States Constitution. "Federal preemption is premised on the Supremacy Clause and

manifestation of Congressional intent to exclude state law." Bulchis v. City of Edmonds, 671 F. Supp. 1270, 1273 (W.D. Wash

1987) (citing Chicago & North Western Transportation Co. v. Kalo Brick & Tile Co., 450 U.S. 311, 317 (1981)). As "[f]ederal regulations have no less preemptive effect than federal statutes, " Fidelity Fed. Sav. & Loan Ass'n v. De La Cuesta, 458 U.S. 141, 153 (1982), the FCC has the power to preempt local ordinances which conflict with federal policies. The FCC issued PRB-l pursuant to its power to "make such rules and regulations, and issue such orders, not inconsistent with this chapter, as may be necessary in the execution of its functions. " 47 U.S.C. (sect.) 154(i).

It must be noted initially that this court need not even consider the possible preemption of (sect.) 1143.11(b), as it is the court's opinion that there is no violation of that ordinance as drafted. Where a "state's highest court has not spoken to the question in controversy, the federal court must discern how the state courts would respond if confronted with the question. " Hartford Fire Ins. Co. v. Lawrence, Dykes, Goodenberger, Bower & Clancy, 740 F.2d 1362, 1365 (6th Cir. 1984). Neither party has identified any instance in which the Supreme Court of Ohio has had the opportunity to interpret (sect.) 1143.11(b). Certainly, defendant has shown no state court support for the Commissioner's interpretation of the ordinance. See Deposition of Kevin Beirne, at 78-83. "Under Ohio law, " [i]t is a cardinal rule that a court must first look to the language of the statute itself to determine the legislative intent. ... If that inquiry reveals that the statute conveys a meaning which is clear, unequivocal and definite, at that point the interpretive effort is at an end and the statute must be applied accordingly. ' " Id. at 1365 (citing Provident Bank v. Wood, 36 Ohio St.2d 101, 105-06, 304 N.E.2d 378 (1973)).

The Sixth Circuit has also stated that in the absence of state authority, federal courts must be "guided by applicable principles of state law and by relevant decisions of other jurisdictions." Aims v. State Farm Fire & Casualty Co. , 731 F.2d 1245 (1984). The Supreme Court of Ohio has stated:

> This court has long held that statutes imposing restrictions on the use of private property must be strictly construed. ... All doubts should be resolved in favor of the free use of private property rather than in favor of restrictions on such use.
>
> Gennari v. Andres-Tucker Funeral Home, Inc. , 21 Ohio St. 3d 102, 488 N.E.2d 174, 177 (1986).

See also Pinnacle Woods Survival Game, Inc. v. Hambden Township Zoning Inspector, 33 Ohio App. 3d 139, 514 N.E.2d 906, 908 (1986) (stating that "[s]tatutes or ordinances which impose restrictions upon the use of private property will be strictly construed and their scope cannot be extended to include limitations not therein clearly proscribed") ; and Cicerella, Inc. v. Jerusalem Township Bd. of Zoning Appeals, 59 Ohio App. 2d 31, 392 N.E.2d 574, 577 (1978) (stating that "[i]n determining the permitted use of property under a zoning

Classification in which terms and language therein are not otherwise defined, the common and ordinary meaning of these terms and language must be considered, liberally construing the terms and language in favor of the permitted use so as not to extend the restrictions to any limitation of use not therein clearly prescribed").

The plain language of the (sect.) 1143.11(b) allows for two methods of measuring antenna height. An antenna may either be measured from its base to its top, or from the uppermost point at which it is attached to a building to its top. As long as either of these measurements is shorter than the distance from the base of the antenna to the nearest adjoining property line , there is no violation of the ordinance. Plaintiff's thirty foot antenna will be attached to the building at a height of twelve feet and will be between twenty-seven and thirty feet from the nearest adjoining property line. Since there is no violation of the ordinance as drafted this court need not examine the question of preemption.

The court now turns to the possible preemption of (sect.) 1333.02.(3) In issuing PRB-l, the FCC attempted to reach an Accommodation between the federal interest in regulating amateur radio operators and the state interest in regulating

---

(3) The court will not consider plaintiff's challenge of (sect.)1331.01. Since plaintiff appealed the decision of the Commissioner, he was properly before the Board regardless of the filing of a protest under (sect.) 1331.01.

land use. PRB-l describes the conflict as follows:

> Few matters coming before us present such a clear dichotomy of viewpoint as does the instant issue. The cities, counties, local communities and housing associations see an obligation to all of their citizens and try to address their concerns. This is accomplished through regulations, ordinances or covenants oriented toward the health, safety and general welfare of those they regulate. At the opposite pole are the individual amateur operators and their support groups who are troubled by local regulations which may inhibit the use of amateur stations or, in some instances ,totally preclude amateur communications.
>
> 50 Fed.Reg. at 38815.

PRB-l determines that a limited preemption policy is warranted, and states:

> Because amateur station communications are only as effective as the antennas employed, antenna height restrictions directly affect the effectiveness of amateur communications. Some amateur antenna configurations require more substantial installations than others if they are to provide the amateur operator with the communications that he/she desires to engage in. . .. We will not, however specify any particular height limitations below which a local government may not regulate, nor will we suggest the precise language that must be contained in local ordinances, such as mechanisms for special exceptions, variances, or conditional use permits. Nevertheless, local regulations which involve placement, screening, or height of antennas based on health, safety, or aesthetic considerations must be crafted to accommodate reasonably amateur communications, and to represent the minimum

> practicable regulation to accomplish the local authority's legitimate purpose.
>
> Id. at 38816.

The court concludes that (sect.) 1333.02 is not facially invalid since it provides a sufficient structure for balancing state and federal interests as required by PRB-l. By its

terms the ordinance provides for a balancing of the effect of an improvement on neighboring property values against the reasonable need for the improvement to develop the property. As interpreted by Defendant, however, reasonable need in this situation involves reasonable need for the particular antenna to carry on effective communication of the type desired. See Defendant' Brief in Opposition to Plaintiff's Motion for Partial Summary Judgement, at 16. Interpreted as such, the ordinance could be applied to give reasonable consideration to both the city's local interests and Plaintiff's federally protected interest in amateur radio operation.

The court concludes, however, that the City of Rocky River did not apply the ordinance in such a way as to provide for the reasonable accommodation of amateur radio communications, and therefore, its ability to apply (sect.) 1333.02 as it did in this action is preempted by PRB-l.

It is only too clear from the depositions of Building commissioner Beirne and Gordon Stofer, a member of the Board of Zoning and Building Appeals, that neither the Commissioner, nor the Board had more than a cursory understanding of PRB-l and its requirements. Despite this, the City's actions might still be held legitimate if the decision making process included a reasonable accommodation of the federal government ' s interest in amateur radio communications. Evidence of such an accommodation, however, is totally lacking.

The Commissioner's letter of June 5, 1987 denying Plaintiff's application for a building permit was largely conclusory. There was no indication in the letter that the Plaintiff's needs for adequate communication had been adequately considered. This combined with the Commissioner's obvious lack of understanding of radio communications at the time of his deposition indicates that concerns over property values and neighbors protests may have predominated in the decision making process.(4) The Board ' s verbal affirmance of the Commissioner's decision, unsupported as it is by any written opinion, fails to show any attempt to accommodate federal interests. Quite simply, there is nothing in the record to indicate that federal interests in amateur radio operation were sufficiently considered, or for that matter even adequately understood, by either the Commissioner or the Board.

Due to the court's holding on preemption, the plaintiff's second ground for summary judgement need not be considered.

---

[4] The third ground for the Commissioner's denial of a building permit was the Plaintiff's failure to submit certain technical documents. While the City of Rocky River clearly has the right to require applicants for building permits to submit all necessary technical documents, the Plaintiff has raised the point that the Commissioner's first mention of some of these documents was in the letter denying the permit. It is somewhat unclear from the record the extent to which the Plaintiff met the statutory requirement for a permit. It is unnecessary, however, for the court to reach this point, since the Board's verbal affirmance of the Commissioner's decision was based upon the effect of the antenna on property values and the Plaintiff's need for the antenna.

The only issue remaining is that of damages.

IV. DAMAGES

Defendant claims that due to the availability of qualified immunity all claims for damages against the Commissioner and members of the Board in their individual capacities should be dismissed. The Supreme Court of the United States has recognized that "permitting damages suits against government officials can entail substantial social costs, including the risk that fear of personal monetary liability and harassing litigation will unduly inhibit officials in the discharge of their duties." Anderson v. Creighton, 483 U.S. 635, 638 (1987). In light of this danger, he Court has "generally provid[ed] government officials performing discretionary functions with a qualified immunity, shielding them from civil damages liability as long as their actions could reasonably have been thought consistent with the rights they are alleged to have violated." Id. (citing Malley v. Briggs, 475 U.S. 335, 344-45 (1986), for the proposition that "qualified immunity protects all but the plainly incompetent or those who knowingly violate the law ' ").

The applicability of qualified immunity turns on the "objective legal reasonableness" of the government official's action "assessed in light of the legal rules that were clearly established' at the time it was taken. " Id. (citations omitted). "On summary judgement, the judge appropriately may

determine, not only the currently applicable law, but whether that law was clearly established at the time an action occurred. If the law at that time was not clearly established, an official could not reasonably be expected to anticipate subsequent legal developments, nor could he fairly be said to know' that the law forbade conduct not previously identified as unlawful." Harlow v. Fitzgerald, 457 U.S. 800, 818 (1982) (footnote omitted).

As noted previously, the case at hand turns largely on the extent to which PRB-l preempts enforcement of the local ordinances in question. While PRB-l indicated that local regulations "must be crafted to accommodate reasonably amateur communications, and to represent the minimum practicable regulation, " it also refused to "specify any particular height limitation below which a local government may not regulate" and declined to "suggest the precise language that must be contained in local ordinances." 50 Fed. Reg. at 38816.

In light of this vague language, the court holds that Plaintiff's rights under PRB-l were not sufficiently clear that a reasonable government official should have known that enforcement of the ordinances in question would be violative of those rights. The conduct of the Commissioner and the members of the Board is held to be objectively reasonable, thus entitling them to qualified immunity from damages.

Plaintiff is instructed to submit a brief within twenty days of the entry of this order detailing the grounds and Basis for any further claims for monetary damages. Defendant may respond within ten days thereafter.

IV. CONCLUSION

Accordingly, Defendant's motion for summary judgement is GRANTED to the extent that (sect.) 1333. 02 and 1143. 10 (b) are held to be facially valid, and the Commissioner and members of the Board are found to have qualified immunity from damages. Plaintiff's motion for summary judgement is GRANTED to the extent that the process employed by the City in denying his application to erect his antenna is declared invalid.

IT IS SO ORDERED.

Frank J. Battisti
United States District Judge

I just wanted to thank everyone who commented on the K1EA software, either by e-mail or by posting. I've decided that it was worth checking out for myself, so I've ordered a copy... I guess we'll see after I get it and have a chance to work with it some!

I was also glad to see some sort of a contest discussion thread start... after reading code/no-code and related stuff for quite some time, it was nice to see something different! I've been involved in a couple of Field Day setups and the ARRL 10m contest a few years back, but nothing very serious. If my upcoming week-off vacation provides good weather conditions, I hope to be doing some radio and antenna work to get my gear working properly, and I'll give some serious attention to DX and contesting (at least, as much as one can with a quasi-grounded HF6V vertical and 100watts!).

73 de BJ, KM4RB

(and still working on 20wpm...)

Does anyone out there in net-land know if the R.L. Drake company will repair their radios? And, if so, how do I contact them? (Phone number would be appreciated, as well as address...)

Help! My TR-4C is feeling rather ill...

Well, I saw the Kenwood TH-77A adds in QST and CQ last week, so I called up AES and asked what the scoop was on availability. They said that no one in the US had any stock, but offered to take my order and visa card number. Since the Kenwood rep at Pacificon told me three weeks ago that it would be 3-4 *months* before we saw it, I figured the AES order might come through by Xmas. Surprised me, I got had it on the doorstep when I got home yesterday. (This doesn't say much for the Kenwood rep's repuation.)

I haven't had enough time to really play with it yet. However, I've got some cursory comments:

- it is cute
- it is the same size as the TH-26
- lot's of tiny buttons and I've got large fingers
- PL encoder is already in the unit
- the worst manual I've seen out of Kenwood, they must have rushed it, there are lot's of features but not one clear explanation of what what they really are.
- the 2m receiver seems to pickup a more noise (e.g., cross-modulation and/or computer harmonics) than the TH-26. First impression.
- the main and sub channels have their own volume controls, however the UHF and VHF have fixed squelch controls. The VHF is located under the SUB volume knob, the UHF under the MAIN volume knob.
- keyboard toggle-able transmit lock (I'm glad to see this back)
- push on, push off power switch located above the MONI switch
- keyboard selectable transmit power levels
- DTMF keyboard buttons light in addition to the display
- microphone and 13.8 VDC in are on the top of the radio
- the function id's on the display are *very* tiny and hard to read
- the SHIFT (+/-/s) button is a one-push, the REV button is the function shift of the SHIFT button. Personally, I need the REV button a lot more than I need the SHIFT button and wished they would have done it the other way around.
- They ship a PB-10 with the TH-26, the TH-77 manual describes the PB-10 charging, but they shipped a PB-6 with its different charger with the new radio. The PB-10 can only be charged from a wall charger, the PB-6 has a special charger head that fits over the battery, in addition it also drops into the BC-10/11.

Well, that's about all I've had time to disgest. I've got to go through the manual and try to translate it out into some operational sense.

BCNU,

Mark

Chris,

The input impedance of a half wave dipole is 73+j42.5 ohms. This assumes no losses in the conductors, free space and I believe that the conductors are of a diameter that is negligable compared to the wavelength (its been years since I went through the math to compute this). I don't know anything about MININEC so I cannot help you there, but 80+j40 is close and MININEC may take some of the real world quantities such as conductor diameter and conductor loss into account.

If it is the +j40 that is confusing the issue here, it comes from the fact that there is energy storage in the near field of the antenna. In typical amateur applications we usually tune the antenna length to get a match to 50 ohms. This occurs (or comes closest to occuring) when the dipole is shorter than a half wave. At that point the reactive part of the impedance is near zero and the impedance is a bit above 50 ohms (if my memory serves me correctly). I don't have any of my college texts or an ARRL handbook handy to confirm this at the moment so you might check the handbook.

Just a point concerning what is contained in the battery backed RAM
of the ICOM radios: There is no actual operating code in this RAM.

There is however frequency information that determines where the ham bands are. This information is contained in the lower 256 bytes of the 1KX4 ram in BCD format. Apparently when the microprocessor realizes that there is corrupt data in this area of ram the radio ceases to function.

The lower 256 bytes of the ram are write protected, however one of the pins on one of the connectors will enable writing to these memory locations. When I first found out about this FEATURE of my 751, I called ICOM and asked for a schematic of the ram board, which they supplied without delay. I built up a little board so that I could suck the information out of the ram board and store it on disk so thatawhen the battery failed I could put it back. That was back in 1985, and I have since changed computers so I imagine that excersize probably will be of little use when the battery does fail.

I am curious to learn if any of the backup batteries have started to fail in any of these radios. As I recall, the 745, 751, 271 and 471 all had this ram board feature. If yours has, please post a response and mention how old it is. Icom was saying 7 years was the expected life of the battery, and I am wondering how nervous I should be at this point.

Yesterday's _Honolulu Star-Bulletin_ had a slick four-color brouchure in it advertising the final increment of Mililani, one of O'ahu's most notorious anti-antenna developments. In the back, there was a section about the homeowner's association:

Mililani Town Association

"An integral part of the community since its first meeting in 1969, the Mililani Town Association serves as a built-in business manager for all Mililani property owners.

"'Our prime responsibility is overseeing the upkeep of the community and maintaining overall values,' explains Mililani Town Association Board President Eric Matsumoto, now in his seventh year in the post. 'Basically MTA conducts all the management activities of a business except our product is Mililani.'

"Every property owner is an automatic member of MTA and all homeowners are assessed $12/month per household for dues.

"Under the direction of MTA Executive Vice President/Manager Mary Treuhaft, MTA employs a full-time staff of 30 including 15 administrative staff members and 15 maintenance workers and groundskeepers.

"By charter, MTA is responsible for the upkeep and maintenance of all common areas in Mililani, and the upkeep and operation of all community recreation centers and facilities (list deleted).

"Treuhaft and her staff are also charged with the ongoing enforcement of extensive design covenants and rules of conduct that have been put in place to ensure the planned beauty of Mililani."

(remaining sales text deleted)

Well, there you have it. They don't hide their CC&Rs, they're *proud* of them! Unfortunately, as long as Hawai'i continues to be a sellers', rather than buyers', market, there's little hope of getting around this.

BTW, the developer of Mililani is an outfit called Oceanic Properties, Inc. The main O'ahu CATV company is called Oceanic Cable. Don't know if there's a connnection, but I'd bet a coupla beers on it :-).

Those of you wishing to express a opinion about Mililani's CC&Rs may contact:

Mililani Town, Inc.
95-102 Lalei Place
Mililani, Hawai'i 96789
(808) 623-2821

-...-

Seen on the inter-island ramp at Honolulu International yesterday:

A 737-100 in British Airways colors (navy blue/gray), except for the
Aloha Airlines' orange script "Aloha" along the top of the fuselage.

Tail number/callsign: "G-BADP" !

What I want to know is how did it manage to get here...anyone know the
ferry range of a 737-100?

-...-

And finally....

>You put it very well, and I concur completely except for your fear of Congress.

>We have the best Congress money can buy. [:-(

Or, to put it another way, "No man's life, liberty, or property is safe while
Congress is in session" - Mark Twain (or maybe Will Rogers)

]It doesn't seem practical as a chat machine what with all the individualized
]codes required to key it. It would be a practical way to control patch
]access though. As you probably know, I'm not keen on non-emergency autopatch.

There is a very practical way to control patch access, and it has the advantage
of being legal and required at all times except for emergency traffic:

control operators.

I am curious how many patches there are in the land with full time control
operators, as required by regulation. I suspect that very few autopatches
actually have control operators [and, that includes remote means that
the user himself could employ to be the control operator - on a different
frequency than the repeater itself].

The best way I know to (1) learn the code or (2) increase your speed
is the program pair QRS/QRQ available as shareware. The unique feature
of these programs is that they not only send you random letters, they
listen to what you copy on the keyboard. Then they give you a score.

QRS sends a letter and waits for you to type the correct answer.
It times you for 30 letters and computes your copying speed.

QRQ sends a stream of letters and lets you "copy behind". If you get
30 letters correct, it sends you a ROGER and raises the speed 0.1 wpm.
Any error makes it reduce the speed 0.1 wpm. Just sit back and copy,
and the program adjusts to the best practice speed for you.

These programs are addictive!

Available from Public Brands Software, 317-856-2087, on ham radio
disk HR12.0 -- along with some other interesting programs.

Bad analogy!! And we have gone over this one before.

There is more than one university or college of higher education. In fact there are so many choices, it boggles the mind. Your choice of educational curriculum exists. If you don't like what Stanford requires, choose some other one.

For access to the ham radio spectrum, there is only ONE have radio and only FIVE classes within it. And **ALL** of them have the same code requirement.

In fact we "no coders" are actually trying to make a choice available just like there is in higher education.

RTTY DX Notes 1of3 11/2/90

RTTY DX Notes for week ending 2nd November 1990
BID: $RTDX1102
Part 1 of 3.

I was going to write something about AMTOR operation, but could not do it under about 5,000 bytes. The mind boggles over some of the descriptions bandied over the air, so I went and read my books again. They don't agree with what has been said over the air, so maybe my books are wrong. Or maybe some other people should read some books, especially after page 4.

Our thanks this week go to I5FLN, JA1BLV, OD5NG, TG9VT, VE3XJ, VK2EG, W2JGR and the Tri-State DX Packet Cluster Network. Thank you all for your good information.

Bandpass:

Friday 26:

```

RTTY DX Notes for week ending 2nd November 1990
BID: $RTDX1102B
Part 3 of 3.

QSL Information:

D68VT says to QSL via K5VT.

JX7DFA will QSL via Per-Einar Dahlen, Romoslia 58, 7029 Trondheim, Norway.

ZK1AP is Pierre Asselin At Box 494 Rorotonga, Cook Islands.

KP2N collects his cards via WA4WIP.

KP2BH is ok in the Callbook.

VP8BFH is via Box 60, Port Stanley, Falkland Islands, though a little hard to get cards from him.

CN8YP is via FDXF or F6FYP.
CN2JF is via WA0RJY.

FR0P says send cards via F6BFH.

PJ9W is OH2BGD when he is at home.

CY9CF (the shortest DXpedition on record) will collect his card from Box 4204, F-97500, St Pierre Et Miquelon Is., via Canada.

V73BN says to QSL via Box 8147, APO San Francisco, CA 96557.

Notes of Interest:

V73BN says that he will be QRV most days around 1100 to 1200Z. He may also be around at 0430Z some days. He is looking for AMTOR contacts.

Malpelo Island should be active now, though nothing has been heard at the time of writing these notes. QSL to HK3DDD.

Marianas Islands, KH0AM should be active at this time, again nothing heard. QSL via JE1CKA.

Banaba Is. T33T will be active from November 7th to November 21st, all bands. QSL to OH3GZ. Also, KIYO (ex-ZK3KY) will be active from there as we write these notes.

Juan Fernandez. CE0ZZZ should show up from November 10th until the 18th of November according to F2JD, who is one of the operators.

St Pauls CY9 appeared for about 4 hours. Nothing has been heard
since.

GL DE DX1.

SB RTTY @ ALLBBS $IRDX1190
IRDXA 11/90 Bulletin

BID: $IRDX1190

IRDXA Project Status Report 11/90

The International RTTY DX Assoc (IRDXA) provides RTTY equipment to
DXpeditions and resident amateurs willing to provide contacts from
rare DXCC countries.

Comoros - By now everyone should have worked Vince Thompson K5VT as
D68VT. He had some trouble with a Telereader, but we solved it with a
TV set obtained locally.

Thailand - RTTY is still not authorized. IRDXA PK-232 will be active
at HS1AC (Science Museum) when RTTY is legal.

Tristan De Cunha - Andy, ZD9BV and his bride ZD9CO are both active.
Listen to his Wed/Sun sked with W4FRU on 28466 at 1700.

Rodriguez - 3B9FR made a few contacts with his IRDXA RTTY GEAR but has
been very scarce lately on any mode. Please encourage him.
Papau New Guinea - P29BT will be QRV with IRDXA gear in November.

Malpelo - will be QRV RTTY for the 1st time in Nov. 90 with HK1LDG at
the keyboard, IRDXA equipment in hand. Please, extra greenstamps with
QSL for new one on RTTY.

S. Georgia/S. Sandwich - This very ambitious project has been
scratched for now. Anyone want to go? We're working on another
approach to activate S. Georgia again.

Malawi - IRDXA sending equipment to 7Q7LA as soon as we can raise
about 50 for postage. This potential new one negotiated by W8SEY.

Juan Fernandez - CE0ZZZ (with F2JD = KL7GRF) should be QRV 10 Nov.
with CE3BFX on the keys. G/S with QSL for RTTY new one please.

Bangladesh - Vince Thompson K5VT plans to return as S2VT in late Feb.
with IRDXA RTTY gear. X your fingers.

IRDXA still needs your help. Ongoing projects include CE0Z, 7Q, etc.

Contact IRDXA, 356 Hillcrest St, El Segundo, CA 90245 USA.
Phone (213) 322-7112 or fax 213-322-7114.

Good DX DE W6PQS = WA6PJR

Yet another announcement regarding a balloon launch:

Western Vision Network (WVN) will be launching a helium filled balloon that will carry amateur television on November 18, with an alternate date of December 2 in case of bad weather. The launch site will be northeast Denver near Stapleton airport. The balloon is expected to travel approximately 200 miles toward the Colorado-Kansas border before it reaches an anticipated altitude of 90-100,000 feet. At that altitude, the original 5' diameter balloon will have expanded to 25', at which time it will burst and hopefully return saftely to earth, being slowed by a small chute.

The balloon will be carrying a 4 pound payload. A small CCD color camera, telemetry package, CW beacon (on 2M), 1W ATV transmitter and a 12V lithium battery pack (good for about 17 hours) round out the equipment. The ATV audio contain the telemetry reporting temperature, humidity and barometric

pressure. The video will be transmitted on 426.25 and the beacon can be heard
on 144.34. A large tracking crew, including 2 aircraft, will be used to
recover the payload. The aircraft will also be equipped with ATV gear, and
if their signal can be reliably copied will provide additional excitment
during the recovery process.

The ATV signal from the balloon is on the input frequency of the WVN repeater,
so anyone along the front range of Colorado that can receive this repeater
will be able to observe the operation from start to end. A vdieo tape of the
event will be produced.

If I modified my IC-745 to transmit on 11 meters (CB band) and kept
the power down to 4 watts out, could I legally use it to transmit on
that band?

I don't ever intend on doing this, but I was just curious.

I agree, with just a few exceptions (such as the low bands when QRM within Europe is extreme - we can hear the 400W Gs, but a 400W W doesn't have much chance - but the effect of this on scores wouldn't be that much). Actually, not all that many hams in the U.S. have amps capable of 1500W out, most are in the 800-1200W range, so the effect of running 400W should be more like half an S-uint. The big problem with running 400W out in a contest here on 75 & 160 is that practically everyone's antennas are just about the same. At N4WW I had a dipole on 75 - it was at 120', which is higher than most people, but the advantage over some W1's inverted vee is about 0 db. Take 400W into a big pileup on 75 with an antenna thats the same as everyone else's, and that 3db or less difference in power (which sounds practically insignificant when expessed in S-units), now that 3 db means you just don't work the guy unless you get lucky. On 40, on the other hand, N4WW's 4-el KLM is a much better antenna than the average guy in the pileup has, so I still got through most of the pileups in just a couple of calls (of course, I was spending so much time screaming on 75 trying to work somebody that my 40 meter totals on the first night were pretty bad :-)

>Scott K9MA

Right. This is a big problem on 20, where I only had about 200 Q's and 54 countries by Saturday morning (which is WAY below what it should have been). On 10, power is not really much of a factor. At the 24 hour mark I had 580 Q's and 91 countries on 10, which is pretty good.

Ron WA6DGX

ARRL BULLETIN 44 ARLB044
FROM ARRL HEADQUARTERS
NEWINGTON CT NOVEMBER 2, 1990
TO ALL RADIO AMATEURS

THE ARRL AWARDS COMMITTEE HAS ACCEPTED THE FOLLOWING RECOMMENDATIONS OF THE DX ADVISORY COMMITTEE.

GERMANY. EFFECTIVE OCTOBER 3, 1990, THE GERMAN DEMOCRATIC REPUBLIC, Y2 THROUGH Y9, IS DELETED, BECAUSE THAT COUNTRY WAS ABSORBED BY THE FEDERAL REPUBLIC OF GERMANY ON THAT DATE. CONTACTS WITH Y2 THROUGH Y9 STATIONS ON OR AFTER OCTOBER 3, 1990, AND CONTACTS WITH DA THROUGH DL STATIONS ON OR AFTER SEPTEMBER 17, 1973, WILL BE CREDITED AS THE FEDERAL REPUBLIC OF GERMANY.

YEMEN. EFFECTIVE MAY 22, 1990, THE PEOPLE'S DEMOCRATIC REPUBLIC OF YEMEN, 7O, AND THE YEMEN ARAB REPUBLIC, 4W, ARE DELETED. IN THEIR PLACE, A NEW COUNTRY, YEMEN, 7O, IS ADDED EFFECTIVE THE SAME DATE.

MARCH 1, 1991, HAS BEEN SET AS THE EARLIEST DATE FOR SUBMISSION OF CARDS FOR CREDIT FOR THE NEW YEMEN LISTING. PLEASE DO NOT SUBMIT CARDS FOR CREDIT PRIOR TO THAT DATE. HONOR ROLL MEMBERS WHO HAVE MADE CONTACT WITH YEMEN SINCE MAY 22, 1990, WILL BE ABLE TO UPDATE THEIR CREDITS DURING THE MONTH OF MARCH 1991, PRIOR TO PUBLICATION OF THE NEXT HONOR ROLL LISTING.

"COMMUNICATIONS QUARTERLY" is comming. To assist you who
are wondering what this shot at filling the void left by
the demise of HRM will be like I have talked with Terry
Northup the editor and have asked her to fax me a copy of
the table of contents from the first issue. As soon as
this arrives I will post same to these newsgroups. From
talking to Terry things seem to be really exciting there
with lots of GOOD articles in the works. (I need to get
version 3 of PARHFINDER to her) Her comments on the
magazine specificly are that we should see MORE THAN 100
pages of technical articles per issue. There will be NO
ads mixed in with the articles but there will be ads.

Stay Tuned for further developments.

73,
Ron Todd, K3FR

How about a cheap (used even) CB radio that has a PA
switch on it? You'd just need a speaker and power supply
(both cheap also) then...

I'll offer to buy any FT470 under Scott's conditions for any number of radios. :-)

Seriously Scott, these terms are wildly out of line. For $200 you could get a working, but cosmetically flawed, IC2AT, but not a FT470 in working condition. The FT470 is extremely popular and in high demand. If you find a used one for under $325 you can be sure that there is something wrong with it or the seller is totally ignorant of the marketplace. Written warranties between private parties are extremely rare, but most sellers will warranty that the radio works at the time of sale. Buyer Beware is the watchword.

No one has proposed banning CW operation. They have proposed not requiring Morse testing for certain license/frequency operation. Their attitude is inclusive of people who want to use modes other than manual CW and of people who do want to use manually decoded CW. Nothing in their proposals prevents an individual from voluntarily learning to manually decode CW. Your attitude is exclusive of all people who do not desire to use manually decoded CW modulation. Can you see who the bigot is in this situation?

```
>So:   If there are more people who want to keep it than don't, you lose.
>      If there are more prople who want to trash it than don't, you win.
```

Actually the FCC won't put it to a vote. Their duty is to decide what rules best promote the charter of the Amateur service. Whether the decision is popular with current licensees is only one factor in the process. They must consider the impact on potential licensees as well as current licensees. Their primary concern is good public policy, not protecting vested interests.

Well, lobbying is defined as attempting to influence legislation. I suspect that the NRA Political Action Fund is used to influence _elections_.
A 501(c)(3) organization (such as ARRL) can do lobbying as long as they don't devote a "significant" amount of their resources to it. But there are other classes of non-profit organization. (I'm no expert: that exhausts my knowledge of the subject.) Note that attempting to influence _regulation_ (e.g., FCC Rules changes) is _not_ considered lobbying. ARRL can, and does, put significant effort and resources into that. Fortunately, it is regulation that is usually what we need to

influence. Not much legislation has a direct impact on ham radio, so the need for actual lobbying is small enough that we can do it. As for PAC activities, amateurs could never dig deep enough to compete with the campaign contributions of, oh, say.... UPS, for example. We'd be outspent by just about anybody, so it's better to stay above the fray, so to speak.

> I think you'll find that ARRL is a lot goosier about losing their tax status
> and is probably playing it safe. Let's face it, if they had to start paying
> income taxes on the publishing empire, they'd be in real deep trouble.

I don't know if I'd call it playing it safe so much as making an informed decision as to the most effective way of having the kind of influence over governmental actions that we want to have. Getting into the gutter (my characterization, not ARRL's) with the other PAC players and the industry groups would simply probably not be effective. We have a lot of friends in government who consider ham radio to be a "pure" public interest. As soon as we show up with a roll of bills in our pocket (figuratively), we lose that good will and become just another special interest.

How well the earth works with your vertical depends on your location. In Miami, you may have dry sandy soil (awful) or soil dampened with sea water (ideal).

In my location, mounting the vertical on the roof with four 1/4 wave radials strung out to neighboring trees worked much better than earth-level. It was a Butterfield six-band vertical

with their radials tuned one per band for four bands. The
earth was your usual Northeastern topsoil lawn.

I have one, too (my university club). Would having the radio powered
"ON" while you pull the switcheroo help? One would think that the
battery would only have the power to "hold" memory, but not to operate,
and that the operational voltage would hold memory.

Thoughts?

However, there is no way of telling WHEN or IF it will be used. I don't use CW on the ham bands today. I can't say, nor can anybody else, that I will NEVER use it. In fact, I DO use it -- aircraft navigation transmitters ID in CW. It is nice to be able to recognize what station you are receiving without having to stop and think about it.

Would you rather that the user learn CW only AFTER he decides to get on the frequency?

Two fallacies. One, that no-code denies the opportunity to learn CW -- far from it, and if it's worth learning, people will learn it. Two, that CW will most likely be used -- the vast majority of ham communications lies in voice modes.

>

Just one problem: Slinky is made of steel, not your best conductor
of RF--in fact a terrible one--that's probably why it gets hot as
you go to higher RF. Result: a poor antenna at best, is made even
lossier than it needs to be.

Better you should use copper clad steel wire which can also be
fashioned to act like a Slinky. Most electronics houses carry
this wire, which is normally used for wire antennas because
of the added strength of the steel core..

>Uhhhhh....didn't Walt retire from CBS a LONG time ago??!?

You are correct that Walter retired from his full-time anchor position
in 1981 or so.  However, he is on the CBS board of directors and DOES
have a tremendous say in their operations, ESPECIALLY the news.  I
understand he had a LOT to say on the botched firing of Brent
Mussburger.  Say, would someone on the net please post the CBS address
for us poor people who don't have easy access to that kind of
information?  Also, the address for transcripts would allow us to flame
intelligently....

Gawwd. First we have to hold to the 5/13/20 wmp distinctions even
through it is NOT required by international convention which
requires only 5 wmp for HF work. Now we have to prove how macho we
are by ""One minute solid copy of random code groups."

The thing we must not forget is that ham radio is dying and we will
lose frequencies if we don't get more growth. Most of the Hams are
over 40 years old, silent keys and people who don't use or don't renew
probably outnumber each year's new hams, and we are getting a pathetic
number of young boys and girls coming in.

Since we have to have code for HF according to international
convention, let's drop all code requirements to just 5 wmp, and let's
update the written exams by excluding the kinds of questions and
formulae that one would look up anyway if needed (like time constants,
polar coordinates, etc.), and let's add lots of questions on operating
procedures, packet, etc.

If you mean using a ground rod--nearly worthless--except for lightning protection.

There is nothing carved in granite that says radials need to be some certain length. Quarter wave length radials would be nice, longer would be even nicer, but for limited space, make up for length by using more of them. Nor need they all be of equal length.

Radials do two things for a <= 1/4 wavelength vertical:

1. Reduce loss. Here is where the use of many short radials will help to overcome the inability to provide long ones.

2. Lower the angle of radiation. This is desirable for long haul DX; undesirable if all you wanted to do is talk to your friends in the next county as you have lowered your sky wave. But, (you knew there was a "but"?) here is where LONG radials do their work, and the longer the better, if DX is your object.
